

Abstract

TITLE: The Production Mechanism of Radio Jets in AGN and Quasar Grand Unification.

By Mark Lacy
IPAC/Caltech

Recent advances in estimating black hole masses in AGN show that radio luminosity is dependent upon black hole mass, accretion rate, and a third parameter, probably black hole spin. We discuss the relative importance of these parameters, and indicate a scheme for unifying AGN on the basis of these three quantities, plus orientation.

The research described in this paper was performed at the Jet Propulsion Laboratory, California Institute of Technology, under a contract with the National Aeronautics and Space Administration.
