The North/South Asymmetry in Interstellar Pick-up Hydrogen

D. Winterhalter (Jet Propulsion Laboratory, California Institute of Technology), G. Gloeckler (University of Maryland), E. J. Smith (Jet Propulsion Laboratory, California Institute of Technology), P. Isenberg (University of New Hampshire), B.E. Goldstein (Jet Propulsion Laboratory, California Institute of Technology)

Interstellar hydrogen is primarily ionized by charge exchange with solar wind protons, while interstellar helium is primarily photolionized. Utilizing Ulysses data taken at high helio-latitudes to minimize any contributions from large-scale solar wind dynamics, we analyze daily averages of the pick-up hydrogen flux and pick-up helium flux, as well as daily averages of the solar wind proton density and of the heliomagnetic field.

We find that the pick-up hydrogen flux in the northern heliosphere is significantly larger than in the southern heliosphere, for the period investigated. The difference in flux is increasing with increasing heliocentric distance from 1 to 5 AU. The north/south asymmetry appears not to be explainable by any difference in the charge exchange ionization rate, nor by any unusual wave activity or orientation of the magnetic field. Adding to the puzzle is the fact that the pick-up helium does not show any asymmetry.

Presentation Type: cnp
Category: 28. Other
Submitter: Daniel Winterhalter
Sponsor: 11138
Presenter email address: daniel.winterhalter@jpl.nasa.gov
Presenter phone: (818) 354-3238
Presenter address: Jet Propulsion Laboratory M/S 169/506 4800 Oak Grove Drive Pasadena, CA 91109 USA

Member Type: NONDPS
First Presentation: yes
Session chair: yes
