Recent analysis of Viking Northern Spring/Summer (NVS) images (Clancy et al., 1980) has suggested that the Viking Lander operations area may be a more general region of Mars than previously thought. The observed THEMIS images (Clancy et al., 1980) show that the Viking Lander operations area is a region of flat, plains-like terrain and that the THEMIS images were obtained during the Northern Spring/Summer (NVS) season.

Our analysis of the THEMIS images (Clancy et al., 1980) suggests that the Viking Lander operations area is a region of flat, plains-like terrain. The THEMIS images were obtained during the Northern Spring/Summer (NVS) season.
