Aerogels as a sublimation suppression layer for thermoelectric power system

Jong-Ah Paik, Steven M. Jones, Jean-Pierre Fleurial, Thierry Caillat, and Jeffrey S. Sakamoto
Content

- Introduction
  - Thermoelectric system
  - Thermoelectric materials and sublimation
- Sublimation of thermoelectric materials
- Thermal stability of aerogels
- Aerogels as a sublimation suppression layers
- Summary and Future work
Thermoelectric system

Thermoelectric Power Generation

Seebeck Voltage - Thermopower

- Charge carriers move faster
- Net diffusion to cold side
- Produces Voltage
- $V = \alpha \Delta T$
- Proportional to Temperature Grad.
- Power proportional to Heat Flux
Thermoelectric Materials and Sublimation

- **Near Room Temperature**
  - $\text{Bi}_2\text{Te}_3$ - $\text{Sb}_2\text{Te}_3$ semiconducting alloys
  - For cooling
  - For low temperature power generation

- **Above Room Temperature**
  - PbTe, TAGS, CoSb$_3$ semiconducting alloys (skutterudites)
  - Used for power generation

- **High Temperature**
  - Si-Ge alloys
  - Used for power generation

Photograph showing the decomposition of a CoSb$_3$ sample annealed at 875K for 3 months
Comparison of sublimation rates at the beginning of life in vacuum

Depletion layers of p-SKD (skutterudite) discs after 700 °C heating (disc diameter : 6 mm, thickness : 2 mm)

Depletion layer after 2 hr sublimation at 700 °C
Ave. sublimation rate : ~ 2.77×10^{-3} g/cm²/hr

Depletion layer after 4 hr sublimation at 700 °C
Ave. sublimation rate : ~ 1.7×10^{-3} g/cm²/hr

Depletion layer after 10 hr sublimation at 700 °C
Ave. sublimation rate : ~ 1.49×10^{-3} g/cm²/hr

Depletion layer after 24 hr sublimation at 700 °C
Ave. sublimation rate : ~ 1.45×10^{-4} g/cm²/hr
Thermal stability of aerogels (TGA results)

Silica aerogel with alumina powder

- Total weight loss: ~ 3.5 wt%
  ( -2.85 mg / 81.4 mg)
- Most of weight loss before 700 °C isotherm
- Weight loss rate at 700 °C isotherm: 
  ~6.11×10^{-10} g/sec (pressure: ~2×10^{-6} Torr) (may be in the order of measurement error)

Opacified silica aerogel with graphite

- Total weight loss: ~ 4.2 wt%
  ( -3.8 mg / 92.6 mg)
- Most of weight loss before 700 °C isotherm
- Weight loss rate at 700 °C isotherm: 
  ~2.11×10^{-9} g/sec (pressure: ~2×10^{-6} Torr) (may be in the order of measurement error)

As made

After TGA (700 °C)
Thermal stability of aerogels (shrinkage test)

- Pure SiO$_2$ in air
- 20 wt% Al$_2$O$_3$ added SiO$_2$ in air
- Pure SiO$_2$ in vacuum
- 20 wt% Al$_2$O$_3$ added SiO$_2$ in vacuum

Temperature (°C)

Linear Shrinkage (%)
Thermal stability of aerogels (life time)

- Linear Shrinkage at 700 °C in vacuum is ~ 1 %.
- Aerogels with alumina particles shrink mostly in the beginning of heating and become stable without further noticeable shrinkage. It is believed that the addition of these particles increases viscosity, hence reducing viscous sintering.
FTIR spectra of aerogels

Pure SiO\textsubscript{2} aerogel

As made

After 4hrs at 1000 °C in vacuum

The Si-OH bond disappeared !!!

20 wt\% Al\textsubscript{2}O\textsubscript{3} added SiO\textsubscript{2} aerogel

After 4hrs at 1000 °C in air

The Si-OH bond disappeared !!!

</tbody>
</table>

- No sublimation was detected with aerogel encapsulation at the temperature below 600 °C.
- The value of sublimation rate was decreased by ~ 70 % with the use of dense aerogel (from 50 mg/cm³ to 100 mg/cm³).
Skutterudite legs coated with titania opacified aerogel tested in gradient (700 °C hot side and 25 °C cold side)

- Tested in gradient for several days, and no depletion layer detected.
Post analysis of aerogel encapsulated n-type skutterudite

Hot side cross-sections don't indicate significant condensation.

This is where depletion would be expected, but there is no apparent depletion.
EDS results (machined aerogel (150mg/cc SiO_2 and < 4 mg/cc TiO_2) after 5 day in-gradient test (n-type))

- Area represented as red color shows antimony trace.
- The antimony amount is ~ 0.2 at %
- Penetration depth is very shallow (< 1 mm after 5 day in-gradient testing)
- Top and outside skin of aerogel is believed to show antimony trace from lateral antimony sublimation.

Summary and Future work

Summary

✓ Accurate sublimation rate measurement with the use of TGA system
✓ Promising result of sublimation suppression with aerogels
✓ Excellent thermal stability of aerogels

Future work

❖ Optimization of aerogel
  - Further investigation of the stability of aerogels and transport mechanism of sublimed species through aerogels
  - Developing optimized opacified aerogel with titania
  - Life time test
