Searching for Extra-Solar Planets

- Since the mid 1980s dust disks around distant stars have been observed. Swirls and clear features in the observed disks indicate the presence of planets.
- New Neptune-mass planets reported, 31 August 2004.
 - GJ 436 b (Butler et al) 0.067 M_J
 - 55 Cnc e (McArthur et al) 0.045 M_J
 - HD 160691 d (Santos et al) 14 M_E
- Spitzer observations of Exozodiacal dust (*Astrophysical Journal*, in press)
 - 266 nearby stars surveyed
 - 71 found to harbor disks
- Planets detected through August 2004
 - Blue dots show R-V detections
 - Red dots show transit detections
 - Yellow dot shows microlensing detection

Terrestrial Planet Finder

TPF

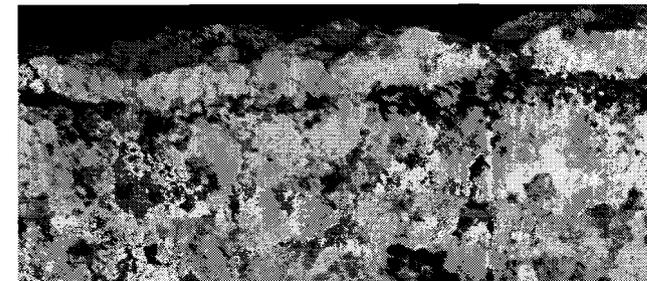

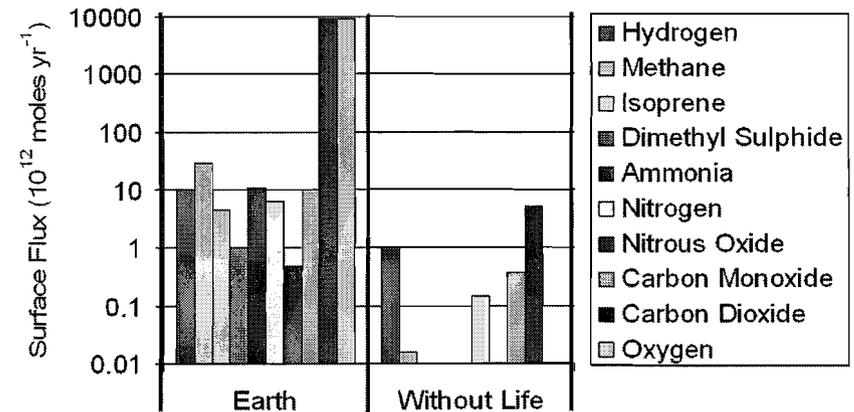

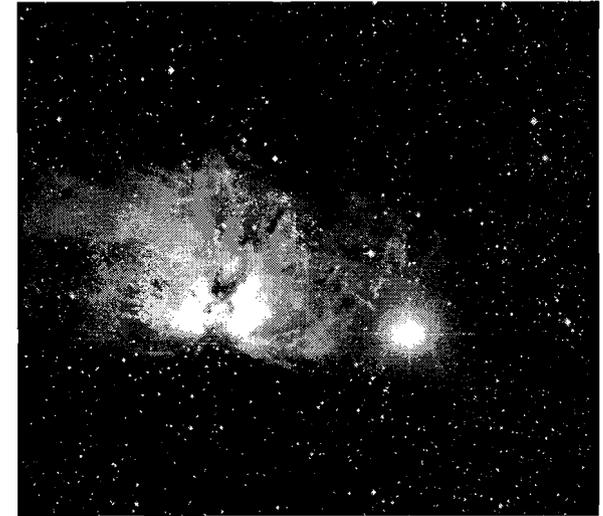

Four Fundamental Facts About the Search for Planets and Life

Terrestrial Planet Finder

1. Planets are a common outcome of star formation
 - Modern theory of *star* formation makes *planet* formation likely
2. The necessary ingredients of life are widespread
 - Observation reveals uniformity of physical and chemical laws
 - Origin of the elements and their dispersal is well understood
 - Carbon bond is unique and ubiquitous! Forget Silicon life.
3. Life affects a planet in a detectable way
 - Our own atmosphere reflects the presence of life
4. Life is Hardy
 - Extremophiles can live in hot (~120 C) acid lakes, near undersea volcanic vents, in underground aquifers, and within rocks in Antarctica
 - Life needs water, a source of energy, and cosmically abundant elements

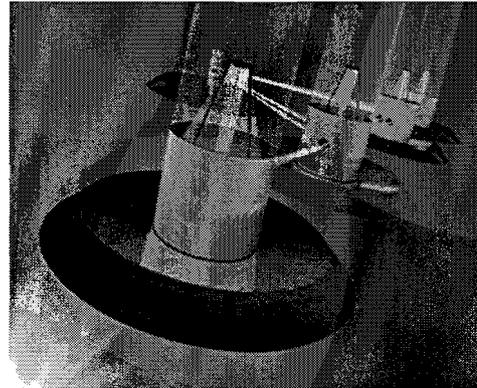

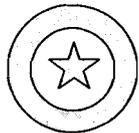

TPF

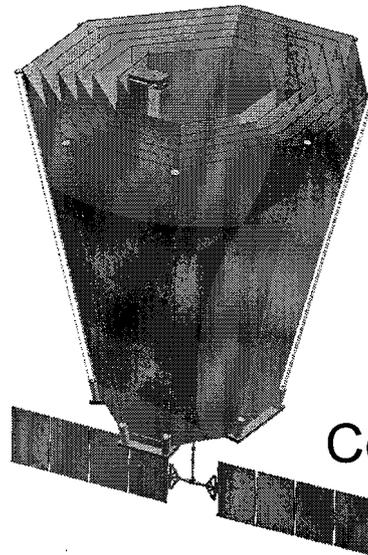

NASA-sponsored Terrestrial Planet Finder (TPF) Program at JPL

MISSION – TWO PARTS

- Search 30 to 150 nearby stars and detect planets in the habitable zone
 - Habitable zone (where liquid water can exist)
 - Defined for each star by its brightness
- Spectrally characterize the atmosphere to determine if any are terrestrial planets

Formation Flying IR Interferometers

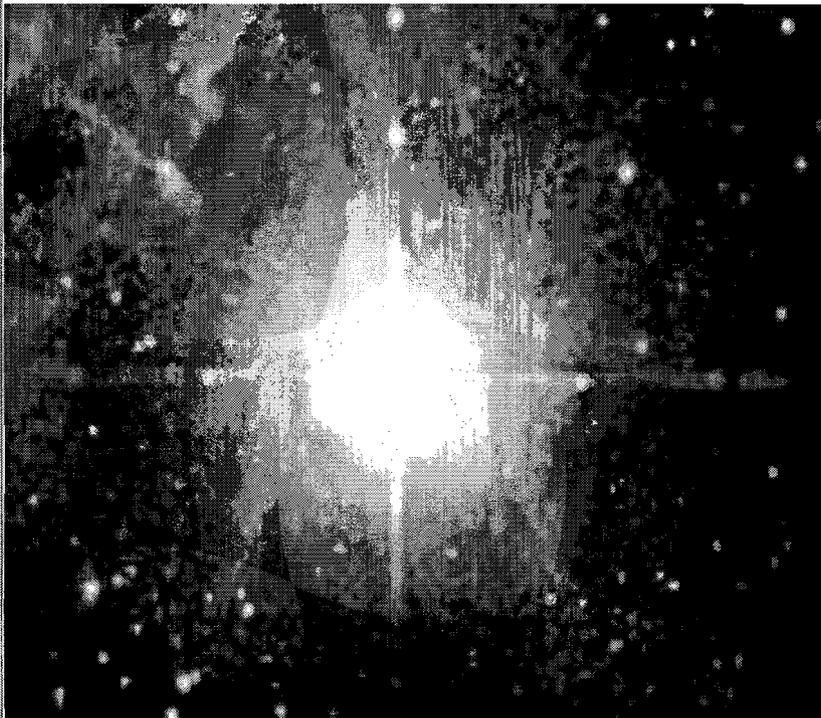

Visible Coronagraphs (my system)

- **PROGRAM STRUCTURE**
- Two teams developing two types of instruments
- Coronagraph to fly around 2014, Interferometer to fly around 2018
- Both wavelength bands needed to discern life-bearing atmospheres (prevent false positives)

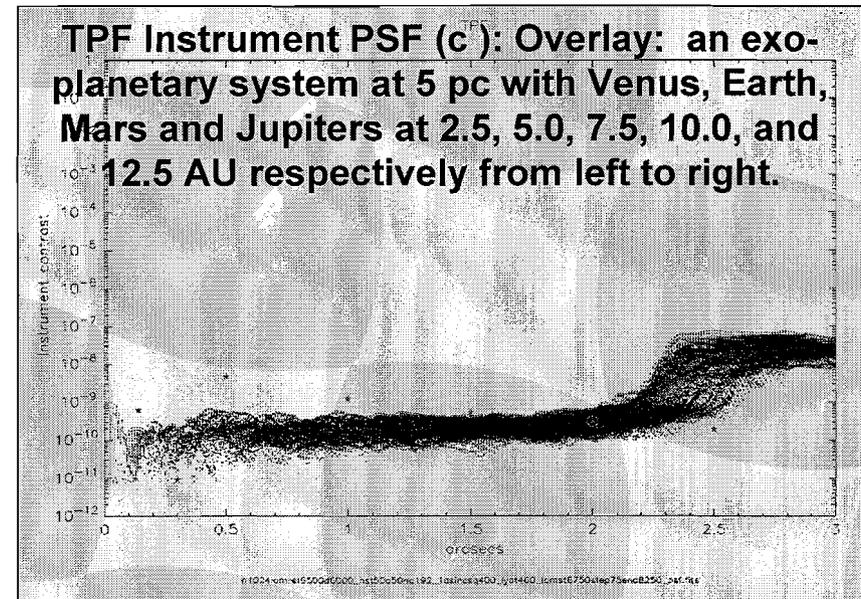

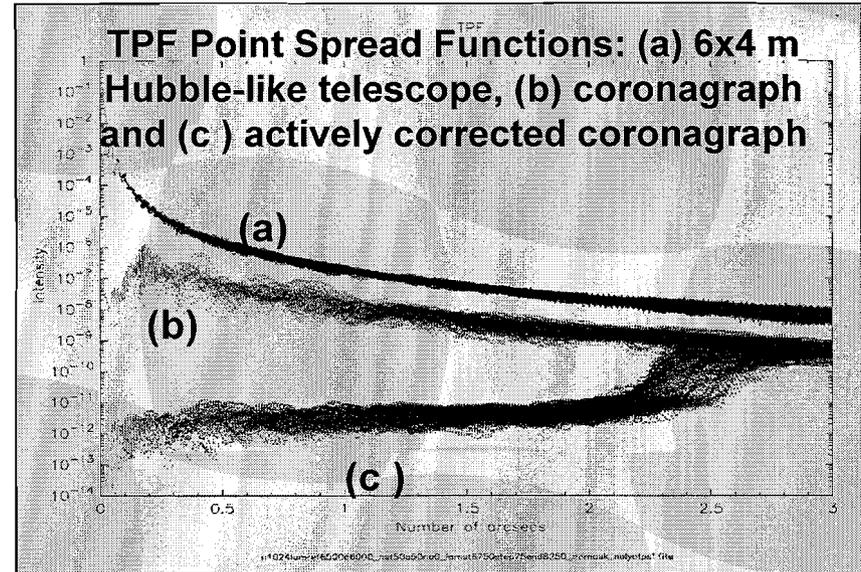

Theoretical Point Spread Function vs Radius

Terrestrial Planet Finder

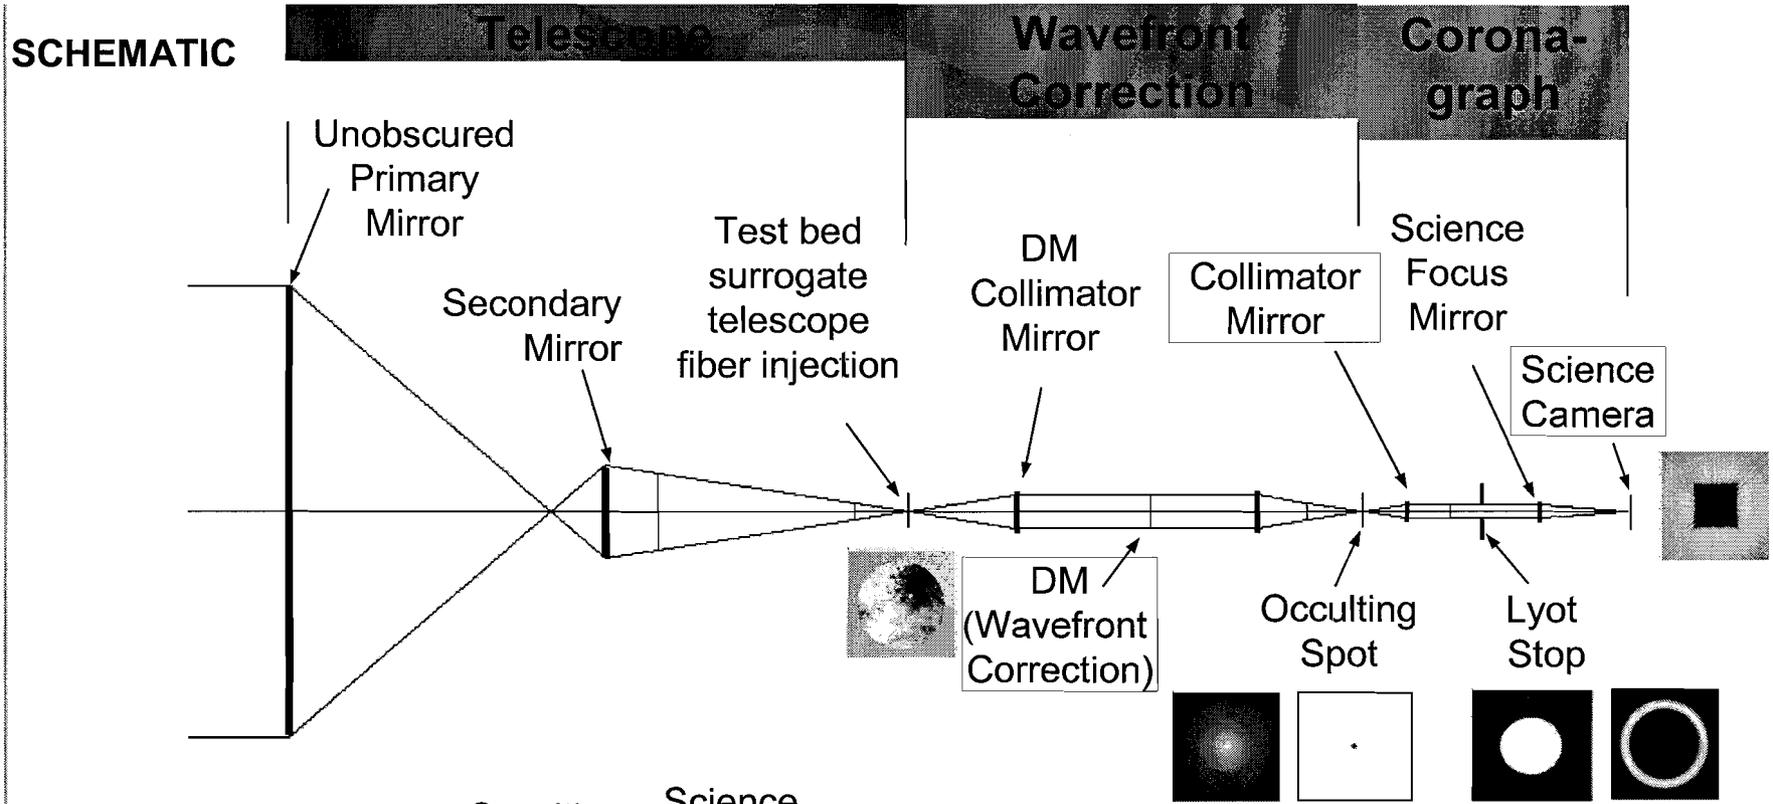

Hubble Space Telescope Image

- Specially designed telescope required
 - Optimized to reduce diffraction speckle
- Wave Front Sensing and Control to correct wavefront errors

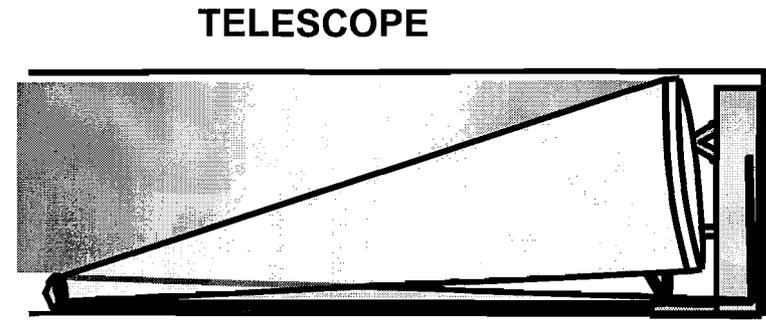

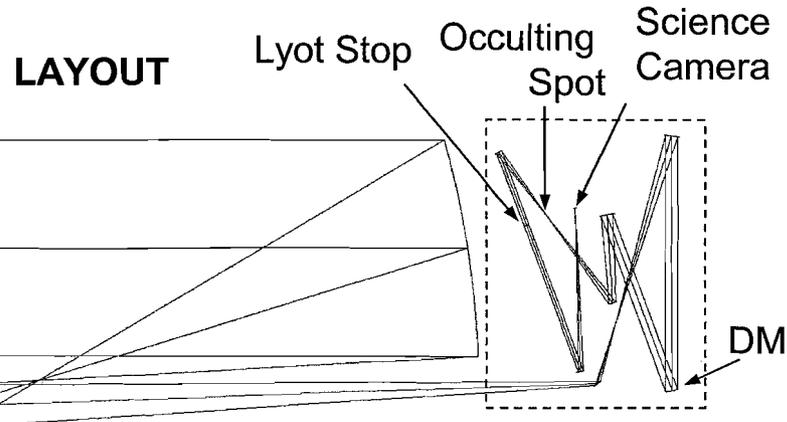

TPF Coronagraph Description - Optics

Terrestrial Planet Finder

Two-fold Approach – Technology demonstration – Develop & analyze an architecture

Technology Demonstration

Current Activities

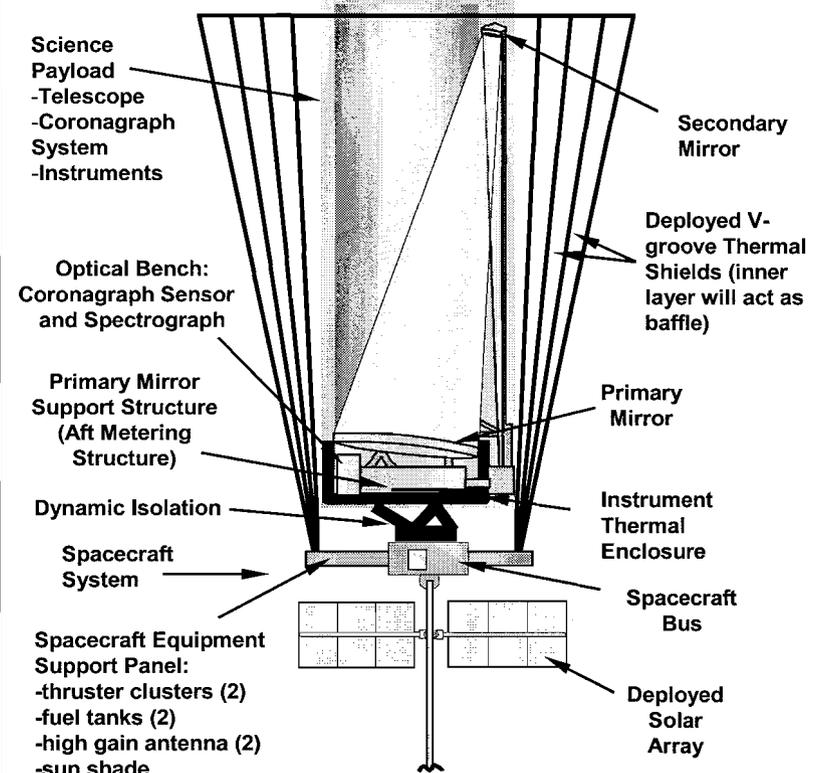

- Starlight suppression
- Wave Front Sensing and Control
- Masks and Stops development
- Large lightweight mirror development
- Coating design and analysis
- Picometer measurement of materials properties
- Modeling tool development that includes diffraction, polarization and precision that is required

Additional Activities

- Laser Metrology – leverage off of technology development from SIM and LISA
- Additional material properties measurements – leverage off of SIM testbeds
- Test and characterize structural microdynamic stability – leverage off of TPF-I studies
- Active Damping techniques – industry contribution

Architecture Development

schematic

- View 35 close stars
- Work at Inner Working Angle = $3\lambda/D$
- Wavelength range: 500-800 nm
- First cut design based on Ball Aerospace Corp. study

successful but limited

HEBS Glass Mask Design/Fabrication

3. Linear sinc²:

$$T(x) = T_{\max} \left[1 - \alpha \left[\frac{\sin(\pi x/w)}{\pi x/w} \right]^2 \right]^2$$

$$T_{\max} = 0.9, \alpha = 1 \text{ (no OD limit)}, w = 82.9 \mu\text{m}, x_{\max} = \pm 4 \times 82.9 = \pm 331.6 \mu\text{m}$$

TPF Terrestrial Planet Finder

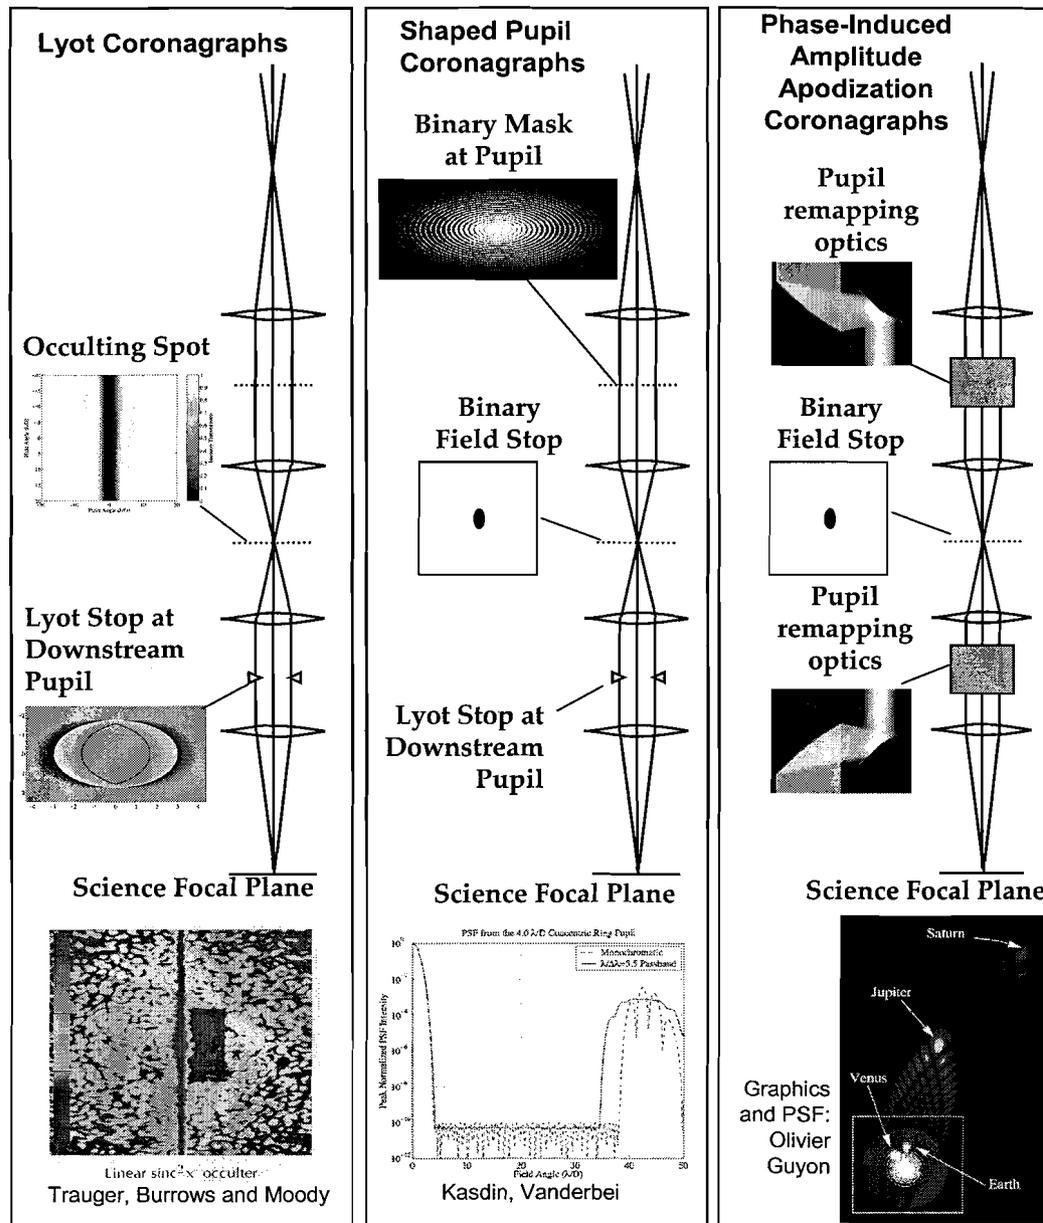

Comparison of Coronagraph Anatomies

- Starlight suppression systems have different characteristics that affect sensitivities
- New types of masks and systems are being designed and built to optimize for insensitivity to chromaticity, polarization, optical component motions

Terrestrial Planet Finder

TPF

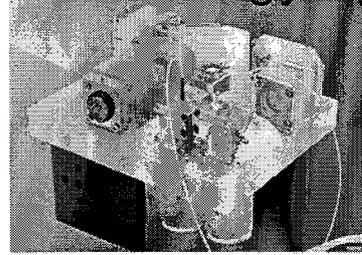

Developing Technologies

Active Dynamics Damping

- Primary source of vibration during observation: Reaction Wheel Assembly (RWA)
- Used commercial RWA vibrations as inputs with Hubble passive damping parameters for models
- Active damping based on Lockheed Disturbance Free Payload system values

Laser Metrology System

Beam Launcher

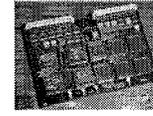

Pre-amp

Post-amp

laser

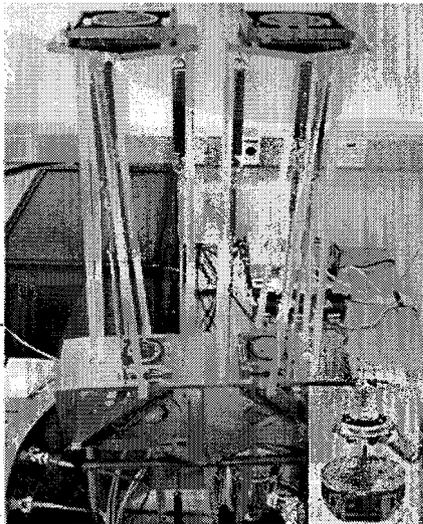

Phase meter card

Optical metrology based on SIM and LISA Technology

- Sub nanometer measurements
- 6-DOF measurement Primary-Secondary positions
- **Allocated tolerances:** ~1 nm z, 8 nm x&y, 5 nr θ_x & θ_y
- **SIM Metrology can meet TPF-C requirements but laser frequency stability needs to be improved**
- **LISA laser stability meets TPF-C requirements, but may need different wavelength**

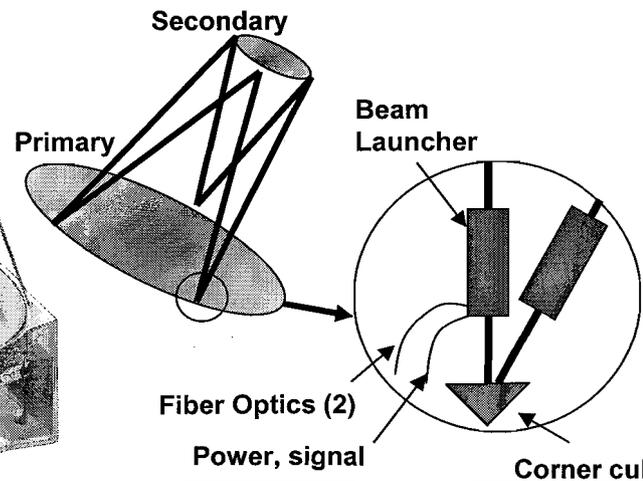

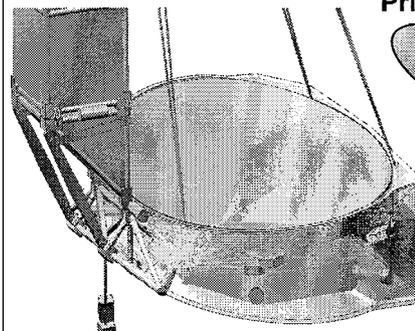

Terrestrial Planet Finder

JPL Cryo Dilatometer

Develop data-base of extremely precise materials properties

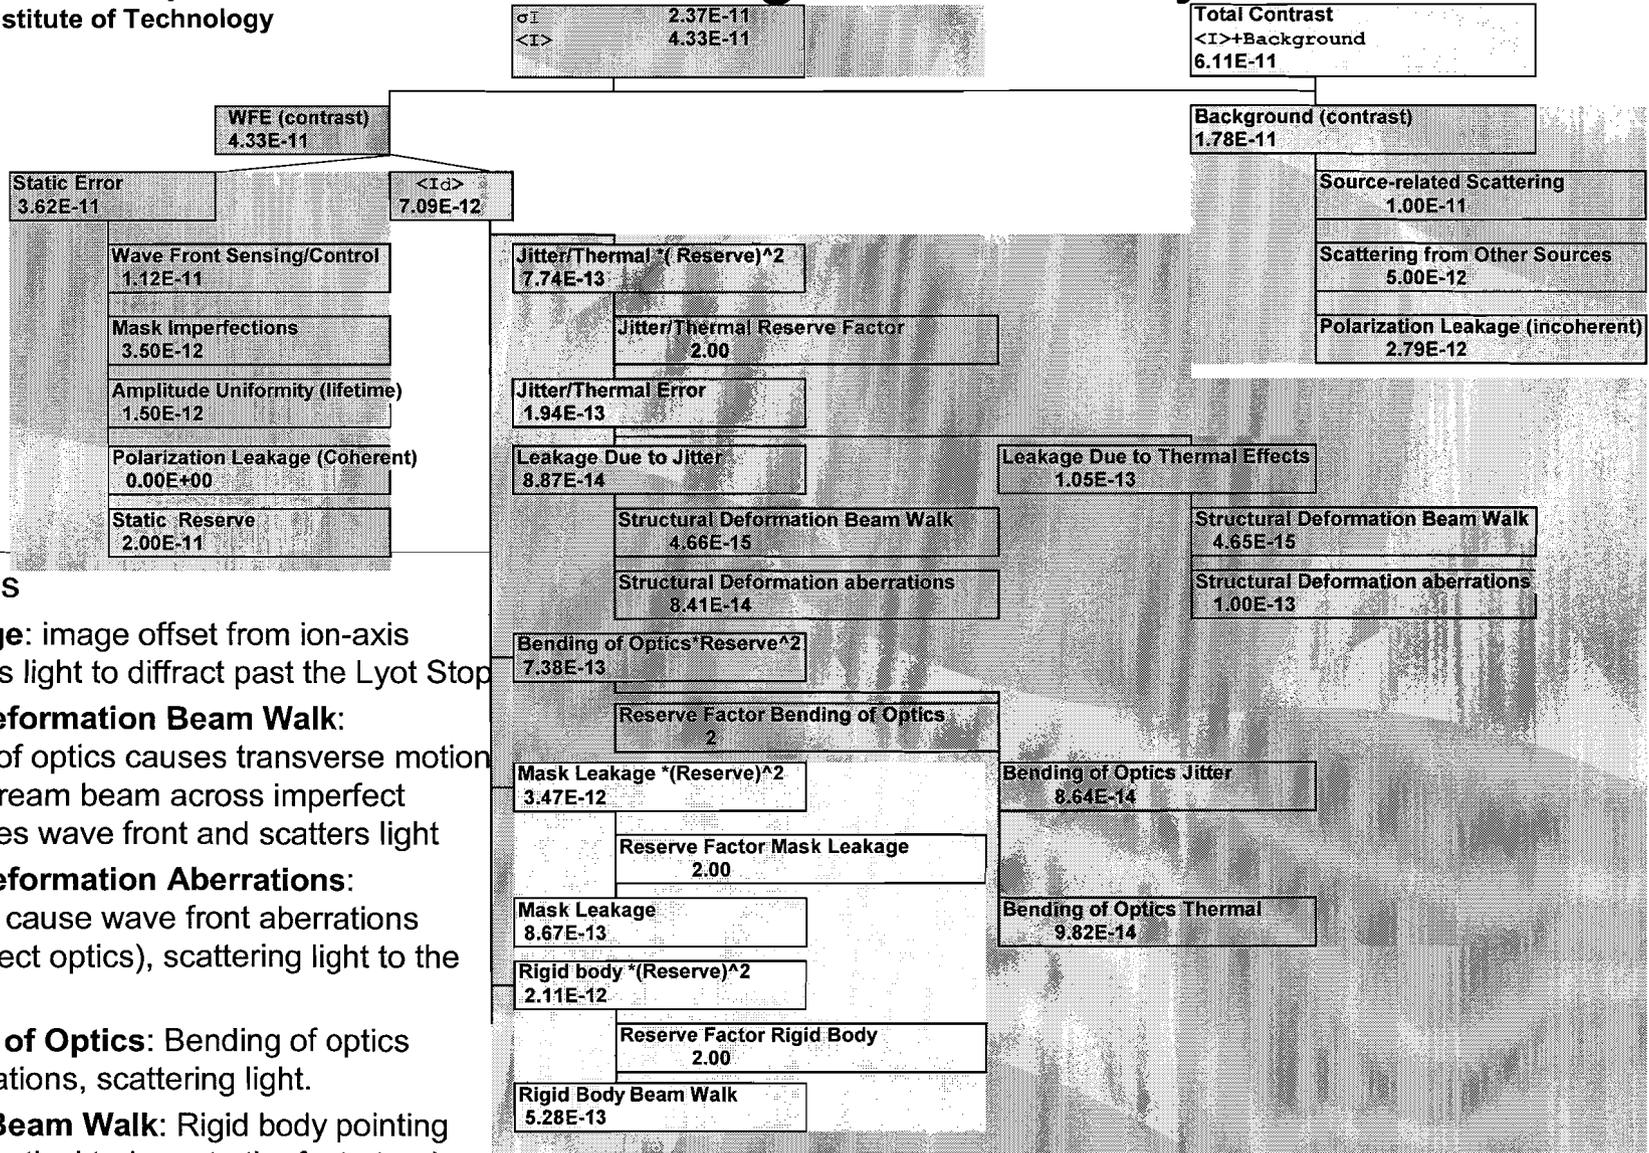

- Some measurement in work
- More needed
- Additionally will use data collected by other projects

TPF

Error Budget Summary

Error Tree Terms

- **Mask Leakage:** image offset from ion-axis position allows light to diffract past the Lyot Stop
- **Structural Deformation Beam Walk:** Tip/tilt/piston of optics causes transverse motion of the downstream beam across imperfect optics -modifies wave front and scatters light
- **Structural Deformation Aberrations:** Perturbations cause wave front aberrations (even for perfect optics), scattering light to the image plane
- **Deformation of Optics:** Bending of optics causes aberrations, scattering light.
- **Rigid Body Beam Walk:** Rigid body pointing errors of the optical train up to the fast-steering mirror result in transverse beam motion.

Terrestrial Planet Finder

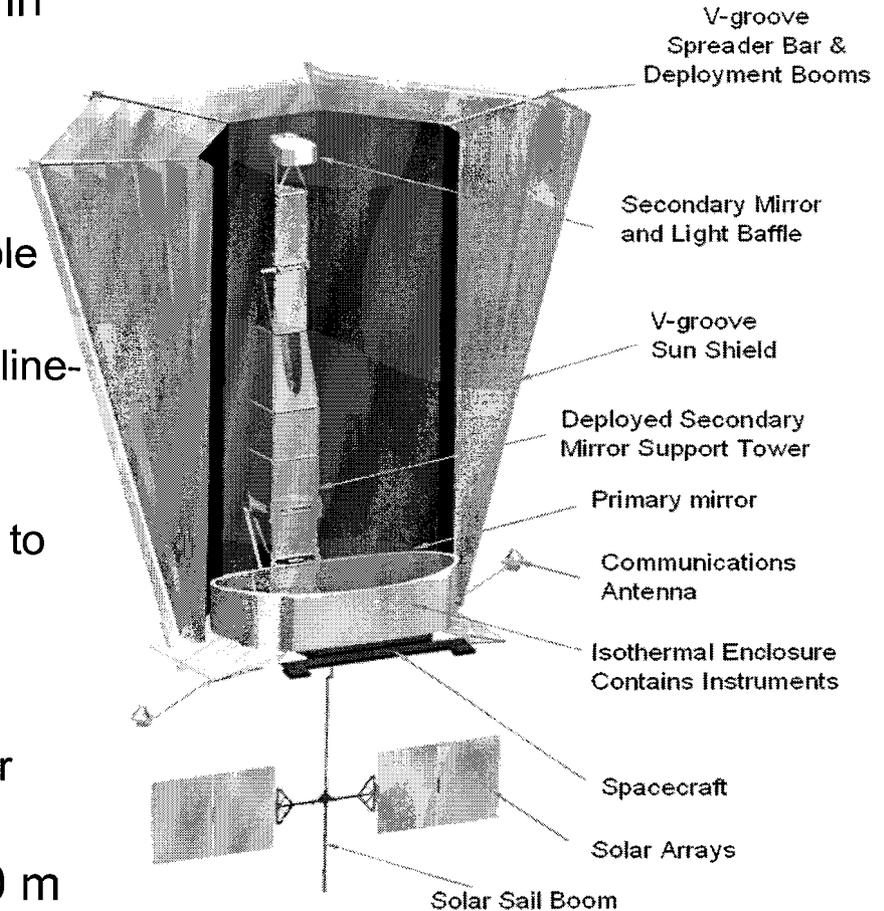

Analysis of Minimum Mission Concept

- Completed modeling and analysis in June
- Mission operations concept:
 1. Acquire target star
 2. Settle, observe and set Deformable Mirror, read out focal plane
 3. Dither (rotate 20 degrees around line-of-sight)
 4. Observe and read out focal plane
 5. Compare observations – subtract to eliminate speckles
 6. Rotate 70 degrees around line-of sight
 7. Repeat steps 2 – 5 to obtain other axis resolution

• Primary mirror 6 m x 3.5 m with 10 m spacing to secondary mirror

• Since then have been working toward developing flight baseline design

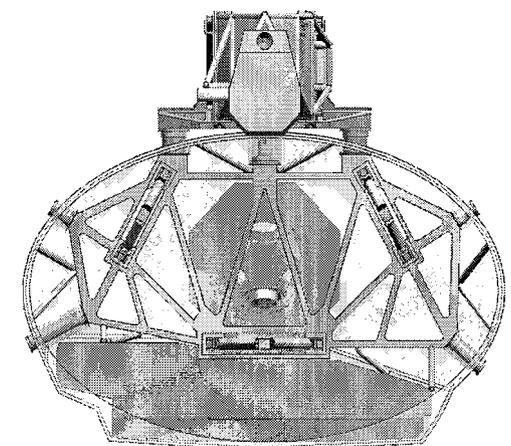

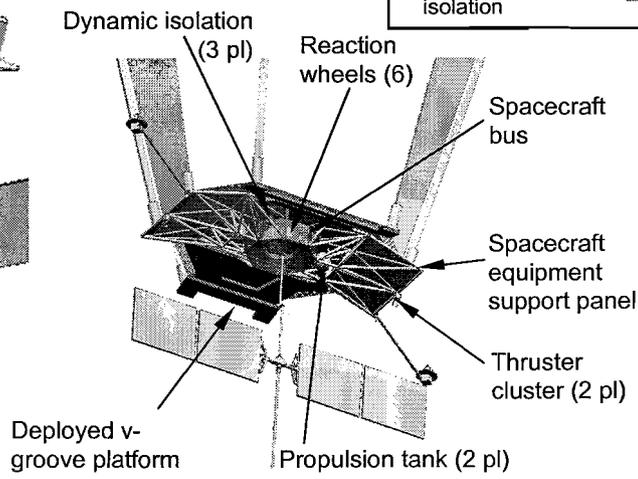

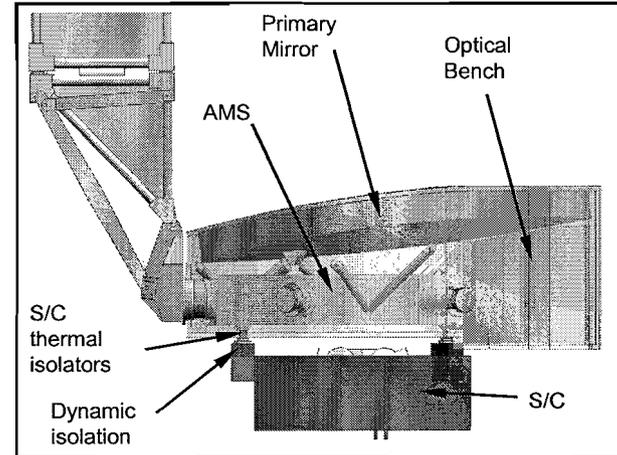

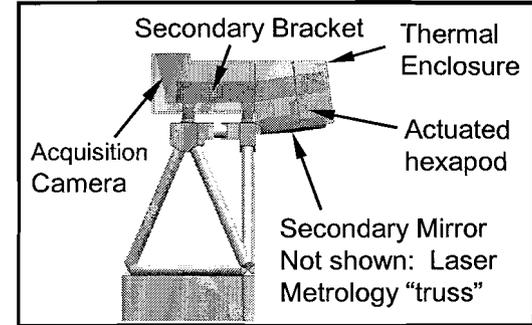

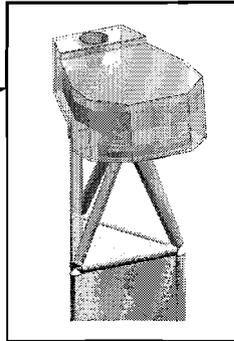

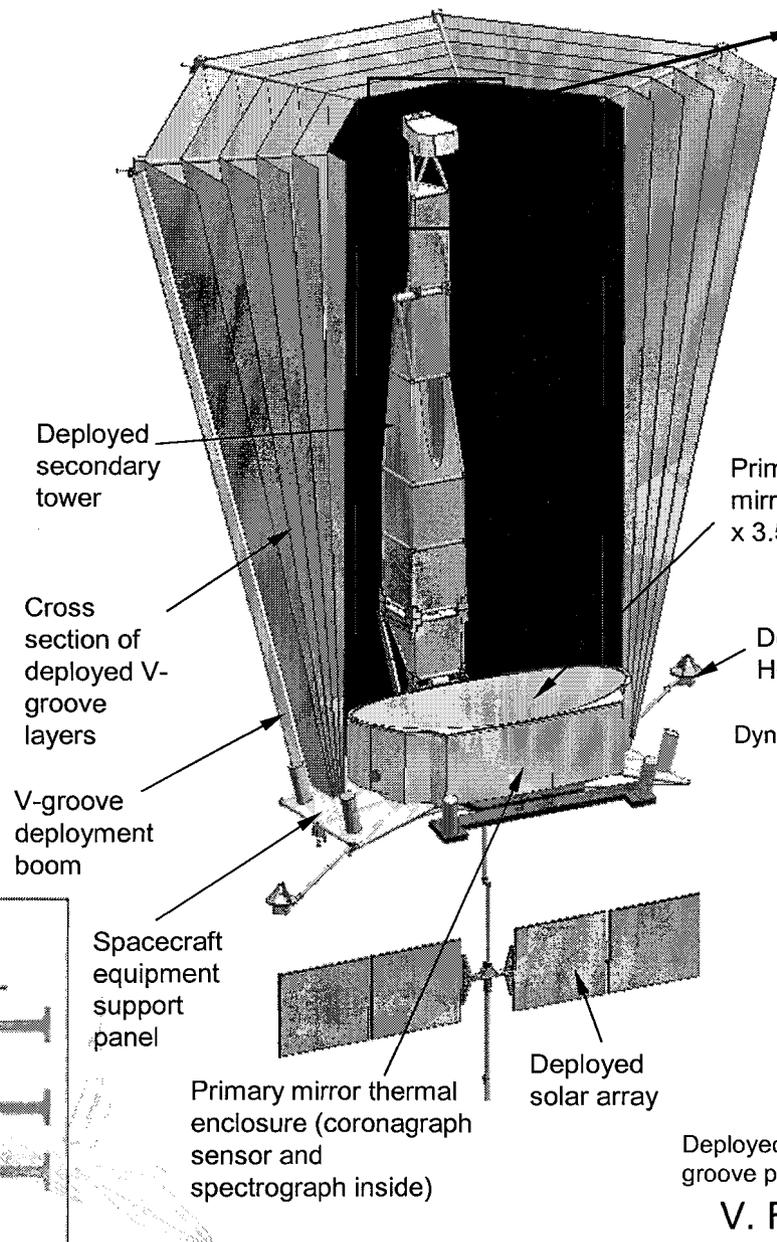

Minimum Mission Concept Assemblies

Summary for PM Design with
Optimized Segment Placement
Based on 80 to 100 deg Dither

	80 to 100 deg Dither		
Zernike Comp	Stead-State Resp (pm)	3L/D Req Specs (pm)	Ratio Req/Resp
4	0.14	2.29	16.21
7	0.19	0.29	1.47
11	0.09	0.14	1.64
12	0.11	0.29	2.53
13	0.07	0.29	3.86

Results for 170 to 190 deg Dither
Using **Optimized** Segment Placement

	170 to 190 deg Dither		
Zernike Comp	Stead-State Resp (pm)	3L/D Req Specs (pm)	Ratio Req/Resp
4	0.02	2.29	126.52
7	0.06	0.29	4.88
11	0.01	0.14	22.70
12	0.01	0.29	40.28
13	0.03	0.29	9.93

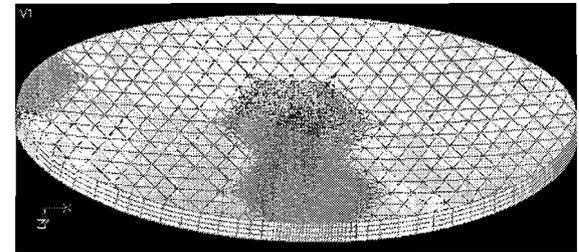

Note: The results for PM with optimal segment placement are **steady-state** (conservative for dither)

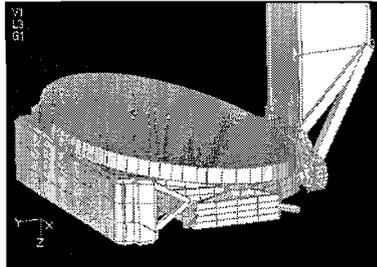

Structural and Dynamic Modeling and Analysis

Dynamic Vibration Input:

Reaction Wheel Assemblies with two layers of passive vibration isolation

Dynamic Results
 - 2 stage passive isolation

Materials Used:

ULE Glass (Ultra-Low Expansion Titanium Silicate Glass by Corning)

- Primary & Secondary Mirrors (good thermal stability)

K1100/954 Carbon Fiber Composite

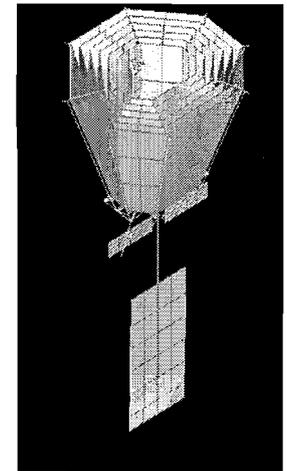

- Primary & Secondary Mirror Thermal Enclosures (high conductivity)

S-Glass Fiberglass Composite

- AMS/secondary tower bracket & SMA isolators, launch struts (low conductivity)

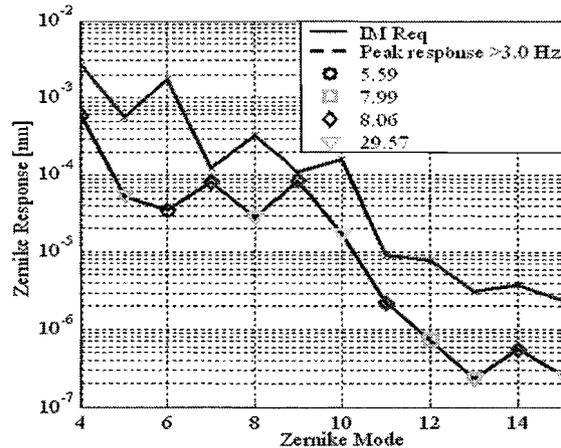

M55J/954 GrEp

- AMS, secondary tower & bracket (good thermal stability & stiffness)

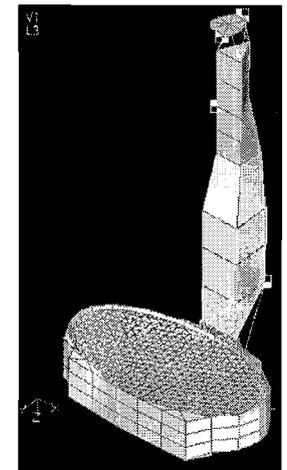

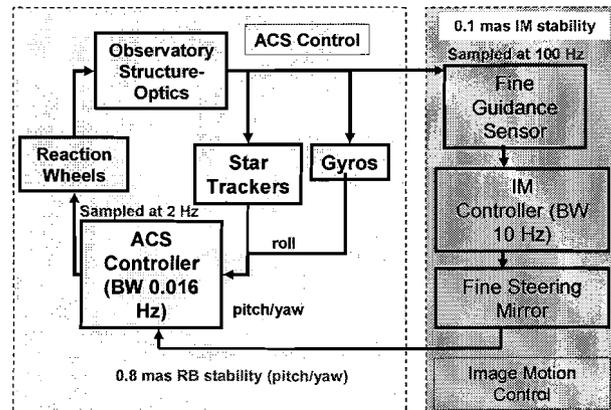

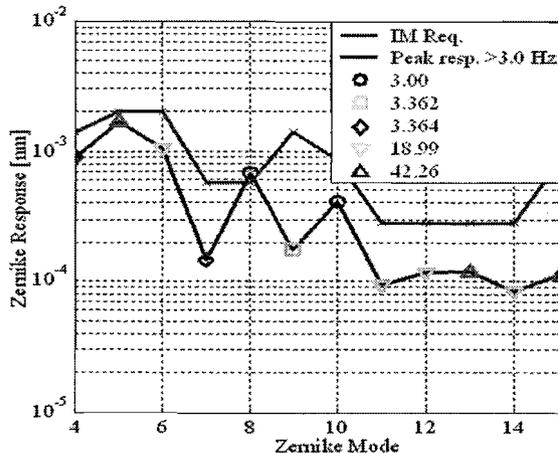

Rigid Optics
 Wavefront Error

Design meets requirements passively

Flexible Primary
 Wavefront Error

Mode 8 exceedance can be avoided by running wheels above 4hz

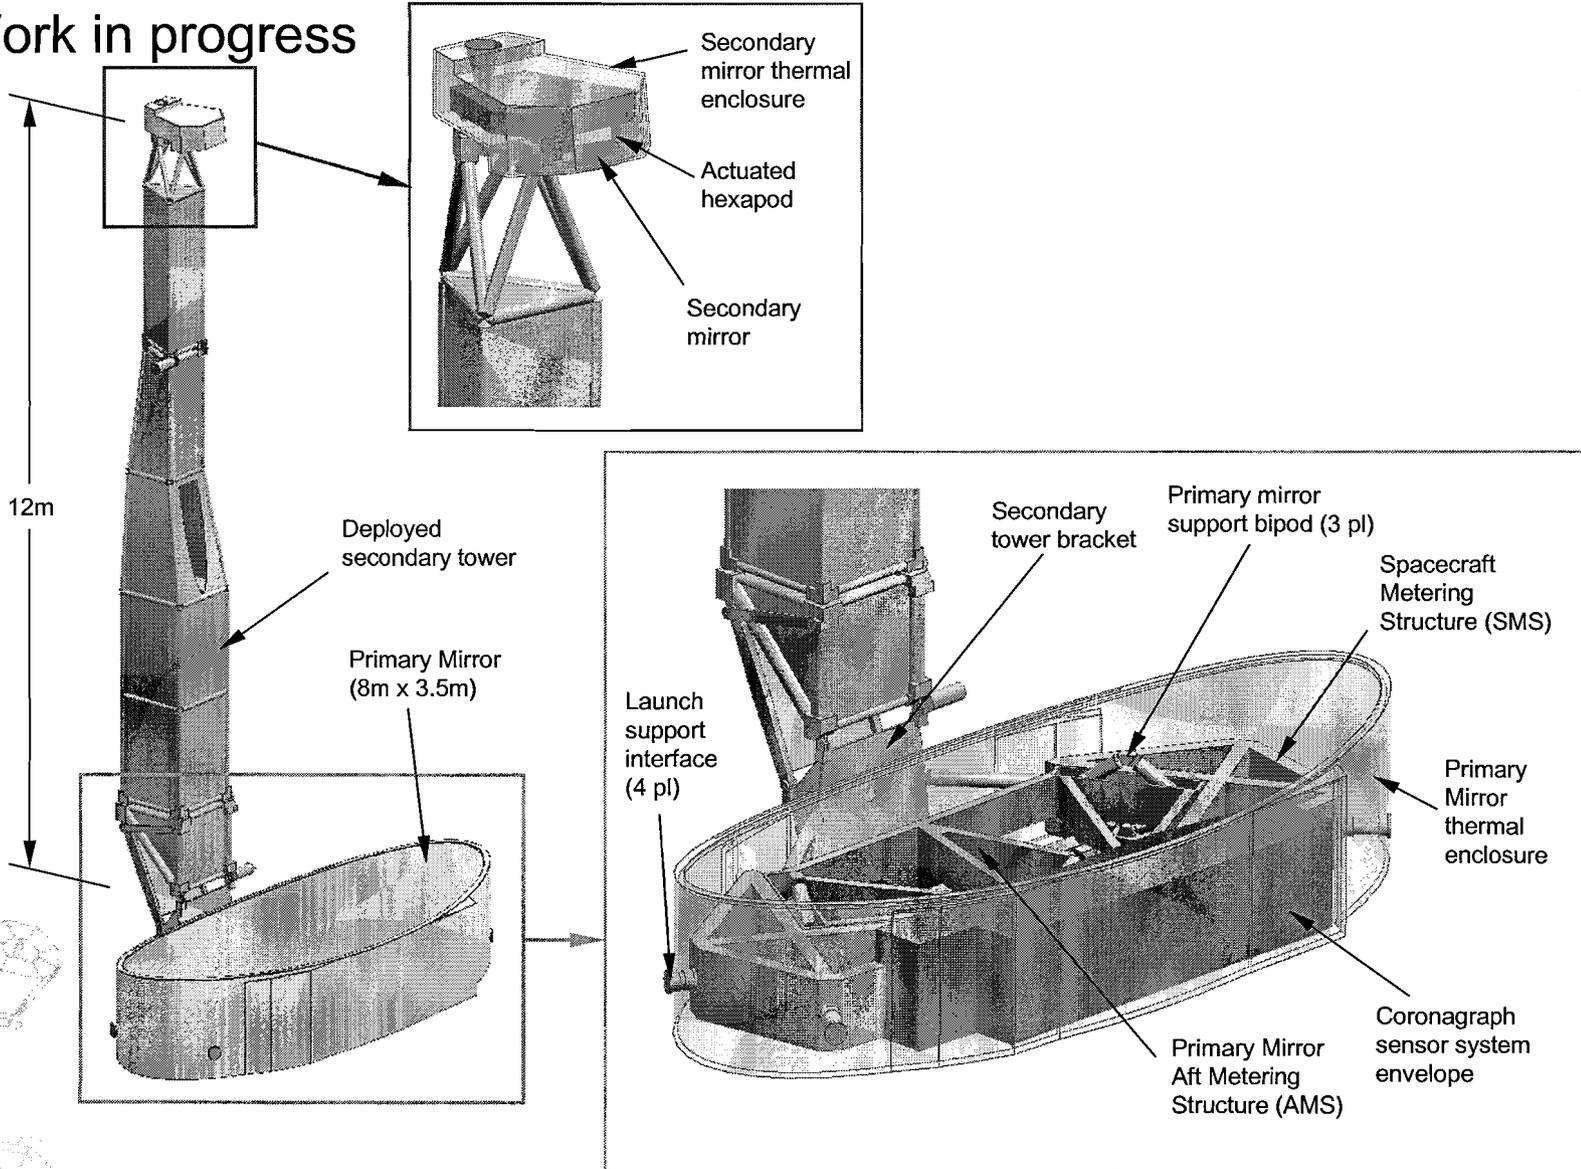

Flight Baseline Architecture – in work

- Many open trades
- Work in progress

Terrestrial Planet Finder

TPF

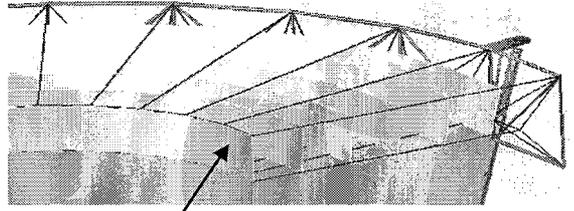

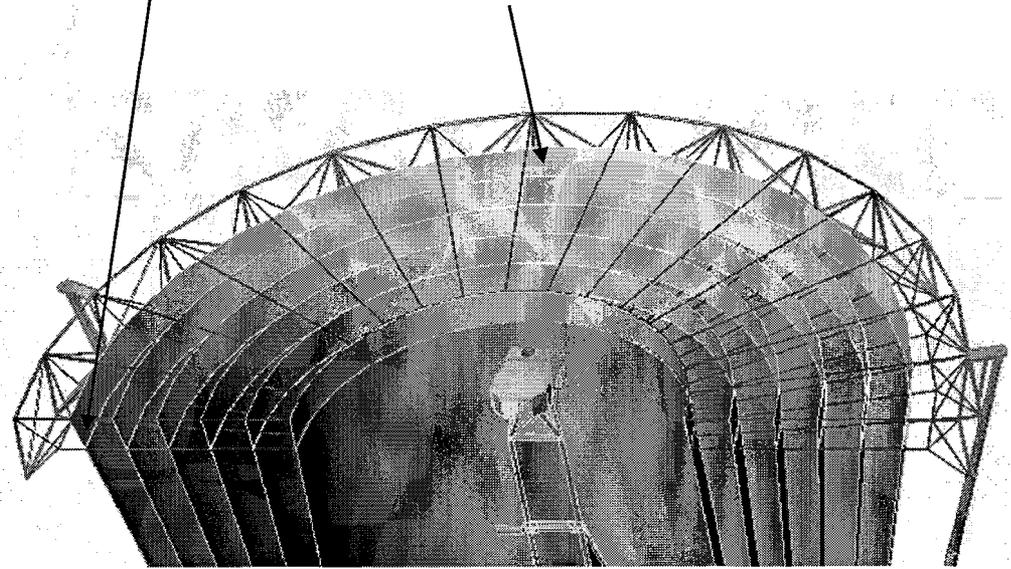

Astro Aerospace NGST Sun Shade work

A typical AstroMesh rim truss supports an array of radial cables.

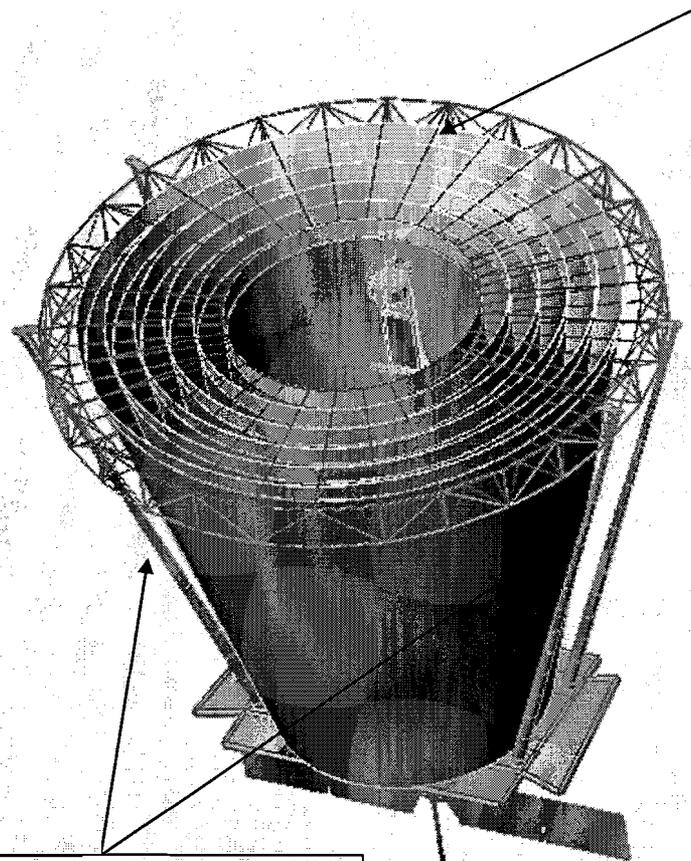

Shrouds are attached to lower radial cables

Shroud extensions between radials shield rim truss

Four Telescopic Booms support the deployed rim truss

Terrestrial Planet Finder

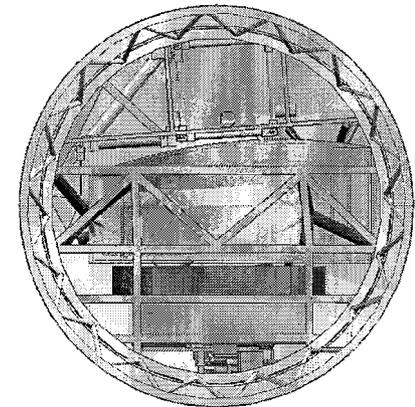

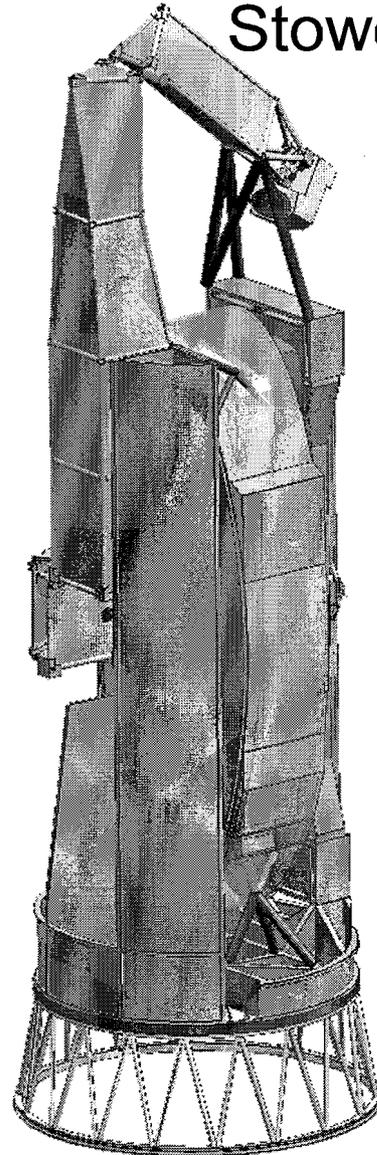

TPF

Summary

- Starlight suppression research is advancing rapidly to approach the required contrast ratio
- The current analysis of the TPF Coronagraph system indicates that it is feasible to achieve the stability required by using developing technologies
 - Wave Front Sensing and Control (DMs, control algorithms, and sensing)
 - Laser metrology
- Yet needed:
 - Property data measured with great precision in the required environments
 - Modeling tools that are verified with testbeds

Stowed in Delta IV-H
