Topics

- Purpose of presentation
- IMPaCT Overview
- IMPaCT Architecture
- Relationship to OCT TechPort
- IMPaCT Capabilities
- Application Security and Access Control
- Future Versions
- Summary

Purpose of Presentation

- To provide an overview of IMPaCT, its architecture and capabilities
- To describe the key drivers for the development of IMPaCT
- To outline capabilities that IMPaCT offers to the NASA's Planetary Science Division and planetary mission developers and technologists
- To describe the relationship between IMPaCT and the OCT's Technology Portfolio Management tool, TechPort
- To outline future capabilities that are being developed for IMPaCT including technology assessment and advanced portfolio analysis

IMPACT Overview

- *Description:* IMPACT is a web-based database tool designed to support NASA's Planetary Science Division in defining its mission and technology portfolios within resources and operating constraints. Allows portfolios of technologies to be constructed and monitored. The architecture also enables users outside of the PSD to input data and develop portfolios.
- *Scope:* Will contain comprehensive information on
 - Current planetary missions and possible future missions, including studies
 - Current technology development activities
 - Potential technology development activities related to planetary science
 - Selected State of the Practice technologies
- *Purpose:* To provide the user, particularly PSD, the capability to analyze their portfolios and future needs. It will also provide an assessment of the status of technologies and their infusion paths.
- *Status:* The current version of IMPACT contains missions, studies and partial technology data sets of interest to PSD. Security and access controls that have now been implemented to allow extending use to other NASA Centers.

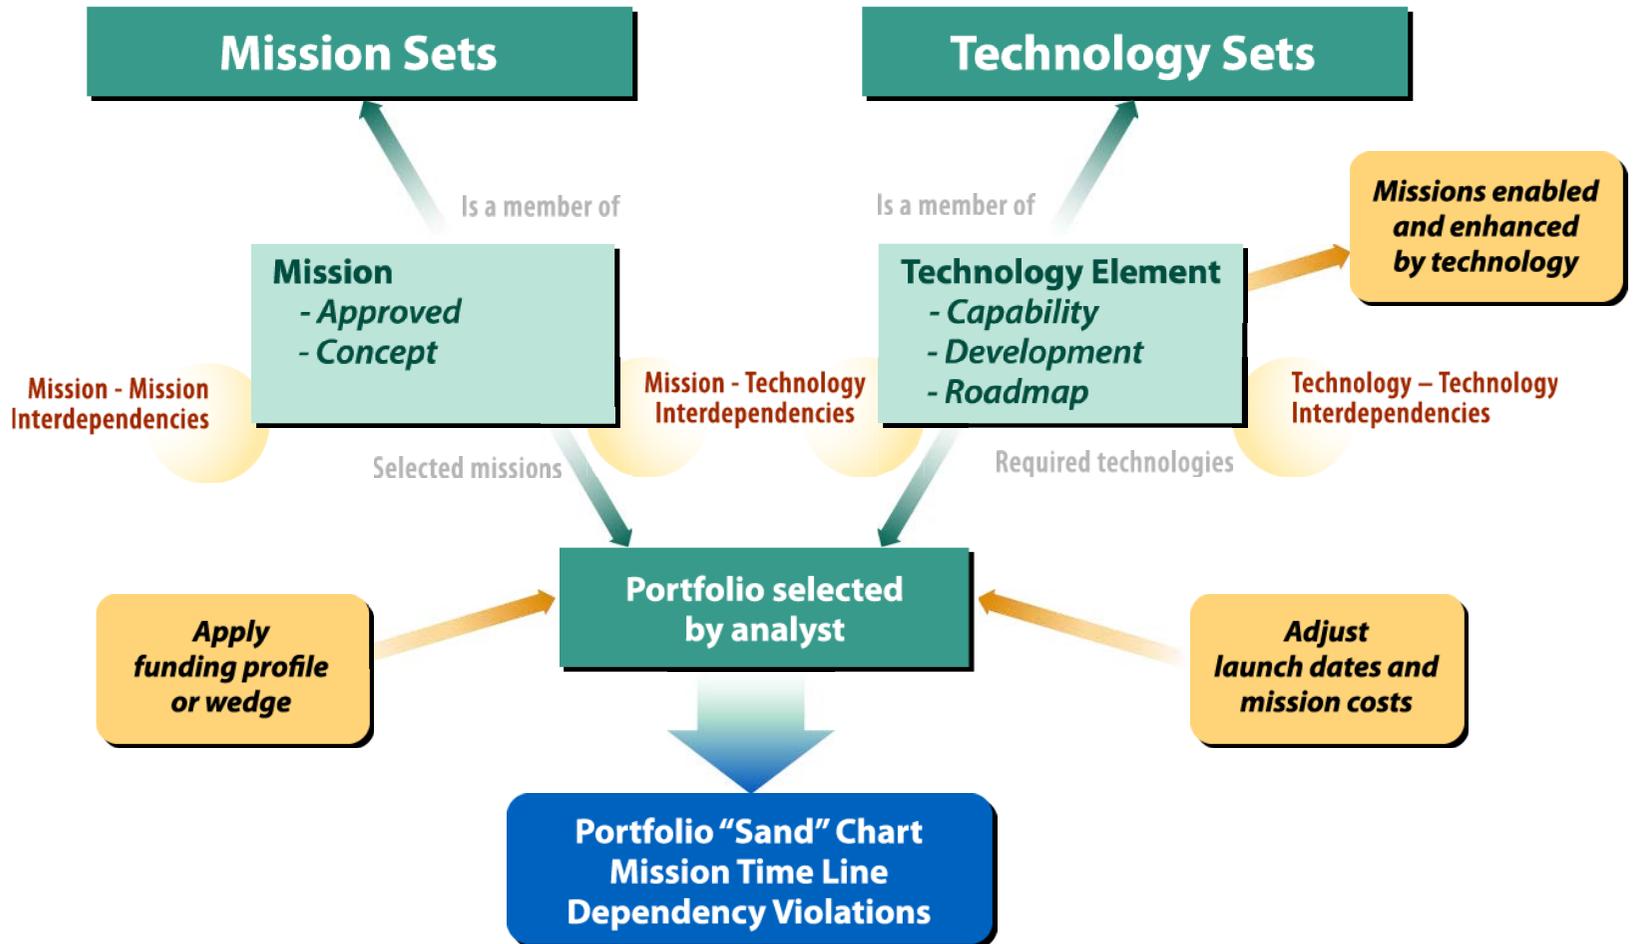

Current Drivers for the Development of IMPaCT

- The Decadal Survey recommended in March 2011 “*the development of a freely available technology database*”
 - customized with the information required by new proposals
 - populated by technologies that have been pre-screened by NASA to ensure that they can be infused with manageable risk.
- The Planetary Science Technology Review Panel recommended in July 2011, the development of a comprehensive technology database that would
 - ensure proper documentation and availability of technology data and development progress.
 - ensure that scientists, technologists, and mission planners have understandable and easily accessible information
 - ensure that technology developments are directly traceable to PSD science goals

Related Activities

- NASA's Office of the Chief Technologist is developing a Technology Portfolio Management system called TechPort
 - TechPort is an online system that provides high level information about NASA funded technology projects
- The IMPaCT team worked on the TechPort development effort through FY12, when the initial TechPort version was released within NASA.
- The IMPaCT team continues to support the TechPort development by participating in the NASA Center Rep working group.
- IMPaCT leverages the data collected in TechPort by
 - Adding data important to PSD mission and technology programs
 - Providing analysis capabilities not available in TechPort
 - Showing the linkages between technologies and missions

The Space Technology Mission Directorate (STMD)

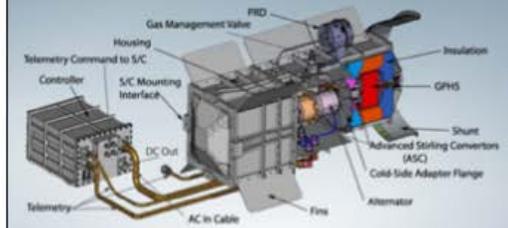

Developing the crosscutting, pioneering, new technologies and capabilities needed by the NASA to achieve its current and future missions.

Welcome to IMPACT

Integration of Missions, Programs and Core Technologies (IMPACT) is a web-based database tool designed to support NASA's Planetary Science Division in optimizing its mission and technology programs. IMPACT contains information on current missions and possible future mission. It also contains information on current technology development activities as well as potential technology development activities. IMPACT enables portfolios of missions and the needed technologies to be constructed and evaluated against resource constraints.

IMPACT is also a powerful information resource providing information at varying levels of detail on current and potential mission and for ongoing technology developments and roadmaps. IMPACT can display this information interactively or it can also be downloaded using reporting routines to standard formats such as Adobe .pdf files, MS Excel or MS Word. IMPACT has been developed at JPL under NASA's Planetary Science Program Support task for supporting questions raised by NASA about future mission and program scenarios.

Mission Set ▲	Description ⚡	Agency ⚡	Directorate ⚡	Division ⚡	
Decadal Survey Mission and Technology Studies 2010 (DS)	Mission and Technology Studies performed in support of the 2010 Planetary Science Decadal Survey	NASA	Science Missions	Planetary Science	Edit
Discovery (Disc)	The Discovery Program goal is to achieve outstanding results by launching many smaller missions using fewer resources and shorter development times. The main objective is to enhance our understanding of the solar system by exploring the planets, their moons, and small bodies such as comets and asteroids. The program also seeks to improve performance through the use of new technology and broaden university and industry participation in NASA missions.	NASA	Science Missions	Planetary Science	Edit
Discovery Missions of Opportunity	NASA Missions of Opportunity give the U.S. scientific community the chance to participate in non-NASA missions by providing funding for a science instrument or hardware components of an instrument. They also offer the possibility to use an existing NASA spacecraft for a new science investigation. Five Discovery Program Missions of Opportunity have been selected.	NASA	Science Mission Directorate	Planetary Science	Edit
Europa Study 2012	Missions directed toward the study of one of Jupiter's moons, Europa, which may hold the potential for life in deep underground oceans.	NASA	Science Missions	Planetary Science	Edit
In-Space Propulsion Technology (ISPT)	The In-Space Propulsion Program work being performed at the Glenn Research Center develops primary propulsion technologies that can benefit near and mid-term science missions by reducing cost, mass and/or travel times. The In-Space Program is working to develop next generation electric propulsion technologies, including Ion and Hall thrusters. Solar Sails, which are a form of propellantless propulsion, are also being developed. Solar Sails rely on the naturally occurring sunlight for the propulsion energy. Other propulsion technologies being developed include advanced chemical propulsion and aerocapture.	NASA	Science Missions	Planetary Science	Edit
Mars Exploration Program	The Mars Exploration Program is a science-driven program that seeks to understand whether Mars was, is, or can be, a habitable world. To find out, we need to understand how geologic, climatic, and other processes have worked to shape Mars and its environment over time, as well as how they interact today. Includes past, current and possible future Mars Exploration missions. Does not include Discovery missions or Mars Scouts (which are now part of the Discovery Program). Mission Concept: Mars Astrobiology Explorer-Cacher Save

Overview

Name: Mars Astrobiology Explorer-Cacher

Acronym: MAX-C

Status: Mission Concept

Mission Set: Decadal Survey Mission and Technology Studies 2010

Data Collection Date - Initial: 1 2011

Last Updated: Overview:

B *I* U | ABC [List Icons] Paragraph Font Size

The proposed Mars 2018 MAX-C caching rover mission would launch NASA's MAX-C and ESA's ExoMars rovers and land them together on a pallet using the "Sky Crane" concept developed for MSL. The strawman instrument set includes a panoramic camera, a near-infrared (NIR) spectrometer, a microscopic imager, an Alpha Particle X-Ray Spectrometer (APXS), and a dual wavelength Raman spectrometer. These instruments would locate, study, and select samples for possible return to Earth. These samples would be acquired and encapsulated by MAX-C's sampling handling system and deposited in a cache or a backup cache. The caches would be placed on the surface of Mars to await retrieval by a fetch rover from the proposed future Mars Sample Return mission.

The proposed MAX-C rover 2018 mission would be launched in May 2018 on a NASA-supplied Atlas V 531-class launch vehicle on a Type I trajectory and would arrive approximately 8 months later in January 2019, at the tail end of the martian dust storm season. The rovers would land in a region of Mars between latitudes 25°N and 15°S.

The rovers would be enclosed in an aeroshell inside the cruise stage for the duration of cruise. Prior to atmospheric entry, the

Mission Concept: Mars Astrobiology Explorer-Cacher Save

Technical Description

Technical Summary:

B *I* U | ABC [List Icons] Paragraph Font Size

Needed Technology Developments:
This mission concept would require the development of several capabilities prior to the mission preliminary design review (PDR). The technology challenges are described below.

Sample Acquisition and Encapsulation
NASA has limited experience in planetary sample acquisition. On Mars, the experience is limited to Viking and Phoenix scoops for sampling regolith. The proposed MAX-C rover would acquire rock cores

Architectural Trades

B *I* U | ABC [List Icons] Paragraph Font Size

Key Trades:
The MAX-C team has already addressed a number of key trades, some of which strongly benefited from the MSL extensive review and similar trades during its design. Many of these trades focus on the landing system. For both MSL and the proposed 2018 mission, extensive reviews of the airbag architecture (Mars Pathfinder, MER) versus the Sky Crane architecture (MSL) versus the legged lander (Viking, Phoenix) have been conducted. In addition, the capability of landing on a pallet versus landing on wheels has been newly explored for 2018. In order to accommodate the two rovers, the team also reviewed the implications of staying with an aeroshell size of 4.5 m or increasing the aeroshell to a diameter of 4.7 m. The team also studied the shape of the

State of the Practice

State of the Practice: "UltraFlex" Save

Overview

Name:

Category:

Description:

B *I* U | ABC Paragraph Font Size

UltraFlex is an accordion-fanfold, flexible-blanket solar array comprising interconnected, triangular, ultra-lightweight substrates (gores). During deployment, the gores unfold and the array is tensioned to form a shallow, umbrella-shaped membrane structure.

UltraFlex is compatible with all solar-cell technologies, including the ultra-lightweight TMM cells anticipated to be ready for flight within the near future.

Technology – State of Practice

- State of the Practice technologies are being incorporated into IMPaCT with participation from JPL Team X subsystem chairs
- Approach is to:
 - Identify key figures of merit (FOMs) for each subsystem (e.g. W/kg for solar arrays)
 - Map the current technology capability into the FOMs
 - Experiment with describing this information graphically for ease of understanding
 - Define interdependencies between different FOMs and different subsystems.
- The PSPS study team is working with the JPL A-team to apply information in the IMPaCT database to mission concept development studies

Portfolio Analysis

- IMPaCT portfolio analyses are used to develop an integrated plan for missions and technologies.
 - Useful for ‘what if’ scenarios.
- Portfolios provide analysis options for:
 - Accommodating funding constraints
 - Delaying the start of mission or technology elements
 - Reducing the cost of mission or technology elements
 - Determining impact of dependencies
 - Does starting a mission earlier impact technology readiness?
 - Does a mission delay impact other missions?

IMPACT Overview of Capabilities

May 15, 2013

Application Security and Access Control

- The basic IMPaCT security application requirements are covered by a general JPL IT Security Plan that describes the controls in place to meet essential security requirements for Scientific, Engineering, and Research Information
- The specific application security and access control requirements are defined in an security implementation plan that ensures protection of IMPaCT information assets for:
 - Confidentiality – Applying restrictions on information access and disclosure, including means for protecting proprietary and ITAR information
 - Integrity - Guarding against improper information modification or destruction, and includes ensuring information authenticity
 - Availability - Ensuring timely and reliable access to and use of information

Application Security and Access Control

- The IMPaCT application resides outside the JPL firewall to allow access by non-JPL users
 - Access to application data is restricted to approved JPL & NASA personnel via secured login – JPL LDAP & NASA IdMAX
 - User roles and associated functions for data access and management have been defined
- The application security plan was completed January 15 and the current version of IMPaCT includes implementation of Phase I of the security plan
 - IMPaCT users are assigned User Role(s) to enable specific view and edit privileges
 - Access to data items and data functions are managed by User Roles
 - Each data item is owned by a user who can choose to keep data private (in a private work area) or make it available on a selective or general basis
 - Data configuration control is enhanced as only authorized users can make changes

Improvements Planned for Future Versions

- Technology assessment capability, including technology relevance, readiness (TRL) and infusion
- Explicit definition of environmental requirements for the technology
- Instrument developments and target mission applications
- Alternative methods of inputting data – keyboard, Excel, PDF. Goal is to make this user friendly.
- Data export capability. Goal is to provide IMPaCT data to other analysis and reporting tools.
- Printer friendly reporting

Examples of Technology Applications

- Types of assessments which the 4X Planetary Science Program Support task has been asked to conduct include:
 - Technology relevance – e.g., to PSD, Mars Program, Outer Planets Program. Changes in relevance to be tracked as the portfolio is updated
 - Technology readiness – technology readiness levels and progress in advancing readiness
 - Technology infusion – status of plans for application in ground and flight systems and monitoring progress in advancing readiness
- Technology efforts that we expect to include in the next 6 months include: STMD Game Changing Technologies, STMD Technology Demonstration Missions, ISPT, Early Stage Innovation, Center Innovation Funds and PIDDP (PICASSO/MATTISE)
- New capabilities are being added to IMPaCT as needed to augment our existing analysis tools including adding new fields and summary reports.

Examples of Technology Applications

- Very strong, broad interest in technology assessment from NASA sponsors and other communities.
 - PSD managers want to know what STMD is doing and if it will be useful for planetary science
 - STMD managers are seeking feedback on the relevance of their technologies to future missions
 - AGs, PIs, technologists, mission concept developers seek a clear understanding of what technologies are upcoming and how they might be applied to their area of interest

Summary

- IMPaCT provides a powerful methodology to assess and develop an integrated plan for missions and technologies.
 - The functional capabilities are now in place and the mission and technology databases are being expanded
- IMPaCT provides access to broad sets of spacecraft technology data (and instruments, in the near future) for use in formulation phase studies
- IMPaCT is becoming a resource for the routine technology assessments performed for NASA's PSD.
- Feed back is requested from users to improve the capabilities to meet needs.
