The Orbiter:

- Remote and *in-situ* observations of the coma and nucleus
- 11 instruments
- 2 with strong NASA participation

The Lander:

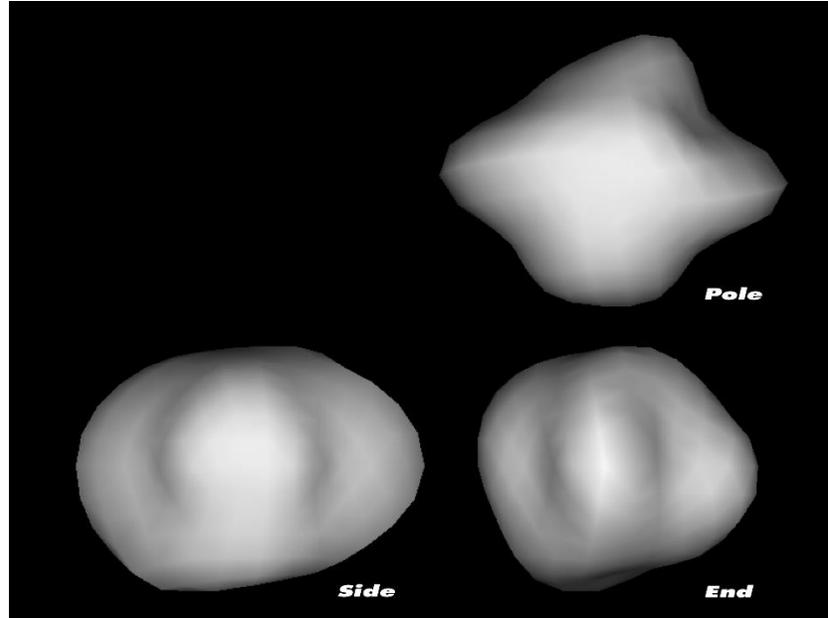

- *In-situ* measurements at the surface of the nucleus
- Power for 3 days of operation
- 10 instruments

- VI. Conclusion

II. The internal structures of comets

- C-G's nucleus seems to be **primordial rubble pile**
- Not formed from pieces of larger parent bodies
- Cycles of sublimation and recondensation forms an "eggshell" on surface
- Ejection and deposition of dust on the surface

II. The internal structures of comets

How can the MIRO instrument help understand the internal structure and evolution of cometary nuclei ?

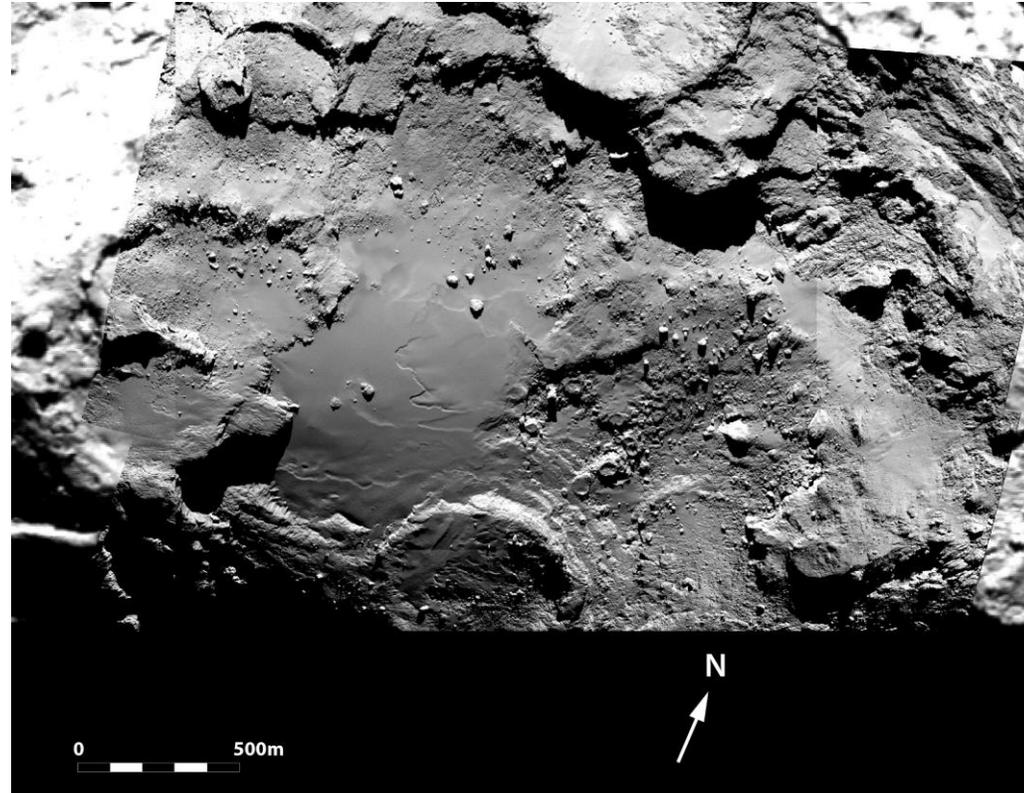

- MIRO is a passive microwave radiometer
- Located on the Rosetta orbiter
- Combined with spectrometer to analyze the coma
- Works at two frequencies (190 GHz, 1.6 mm and 562 GHz, 0.5 mm)
- Can help constrain the top layer of the cometary nucleus (down to 10 cm)

IV. Thermal model & method

What assumptions are made ?

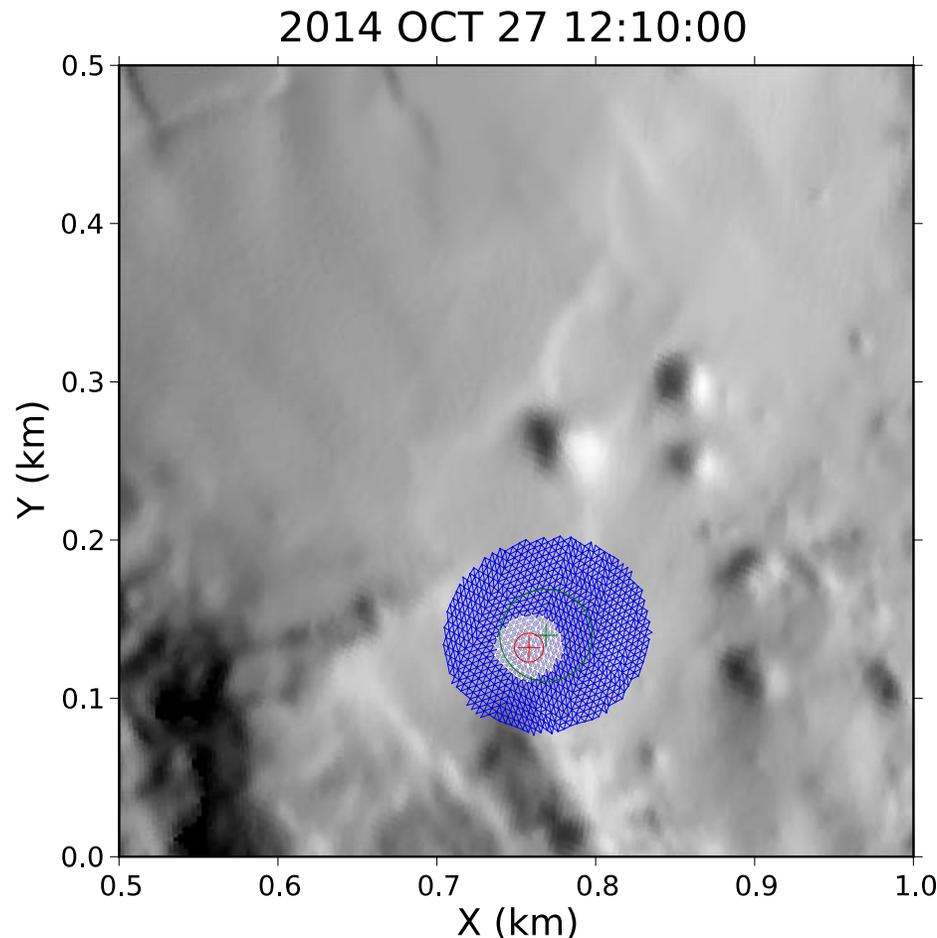

- The ice is crystalline water ice
- The dust is chondritic in nature
- No significant horizontal changes in the areas observed

- I. The Rosetta mission & comet 67P/C-G
- II. The internal structures of comets
- III. The Imhotep region
- IV. Thermal model & method
- V. Results and interpretation
- VI. Conclusion

IV. Thermal model & method

In order to calculate the illumination we use a 12 million facet shape model of the nucleus and SPICE kernels.

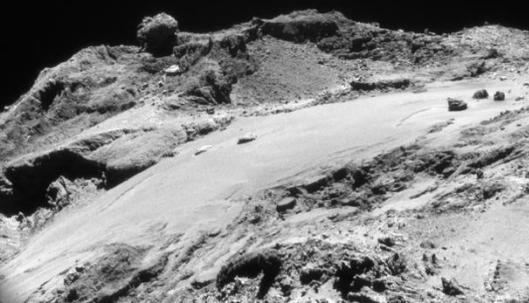

“Full” calculation

- Compute insolation for each tile in the footprint
- Compute temperature profile for each tile in the footprint
- Compute antenna temperature from weighted average

Approximate calculation

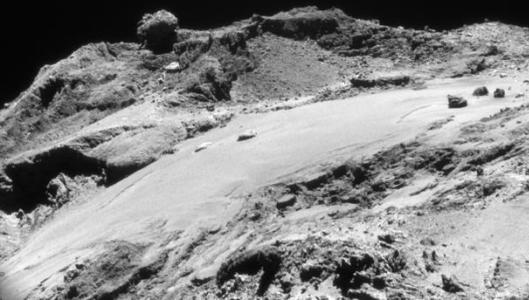

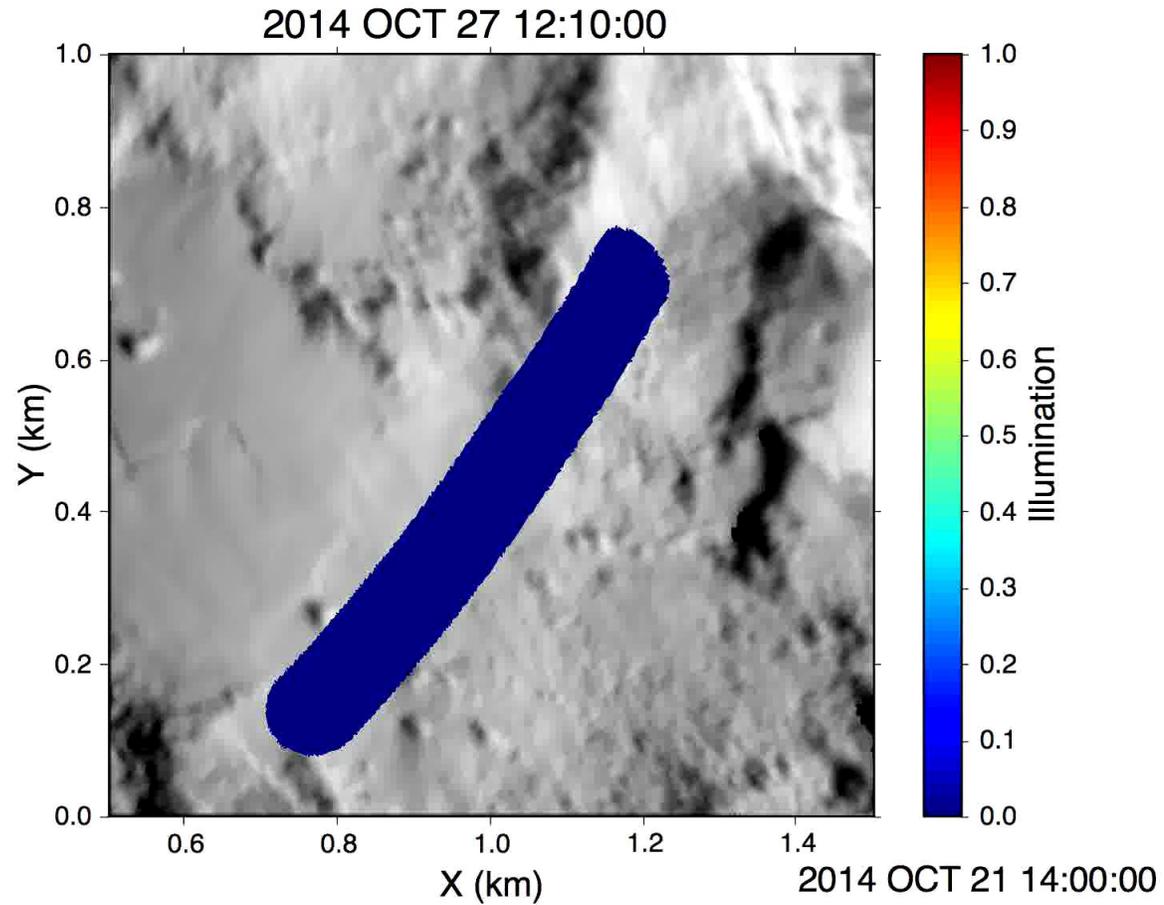

- Compute insolation for each tile in the footprint
- Compute beam averaged insolation
- Compute average temperature profile from average insolation

- III. The Imhotep region
- IV. Thermal model & method
- V. Results and interpretation
- VI. Conclusion

IV. Thermal model & method

- The electrical properties of the water ice/dust/vacuum mixture is unknown.
- To calculate it we can use mixing laws but each mixing law only applies to certain situation.
- To overcome this problem we use the Hashin & Shtrikman bounds (1962).

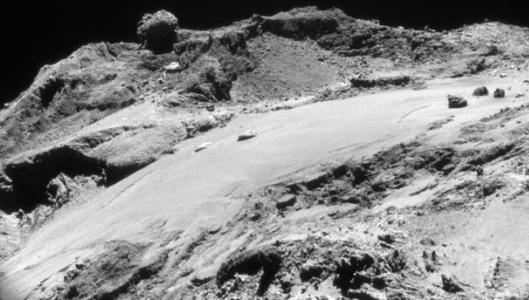

- I. The Rosetta mission & comet 67P/C-G
- II. The internal structures of comets
- III. The Imhotep region
- IV. Thermal model & method
- V. Results and interpretation

IV. Thermal model & method

- I. The Rosetta mission & comet 67P/C-G
- II. The internal structures of comets
- III. The Imhotep region
- IV. Thermal model & method
- V. Results and interpretation
- VI. Conclusion

IV. Thermal model & method

Input parameters:

- Dust/Ice/Vacuum fraction of the top layer
- Dust/Ice/Vacuum fraction of the bottom layer

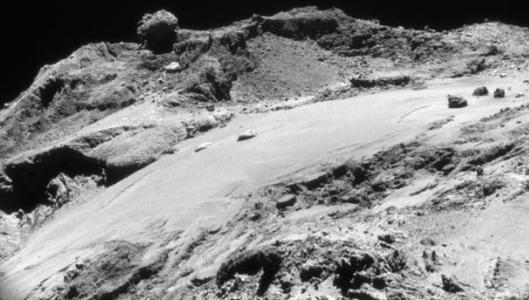

Run model for several comet days and nights until it converges to a stable diurnal cycle

Calculate the root mean square difference between the modeled and observed brightness temperatures

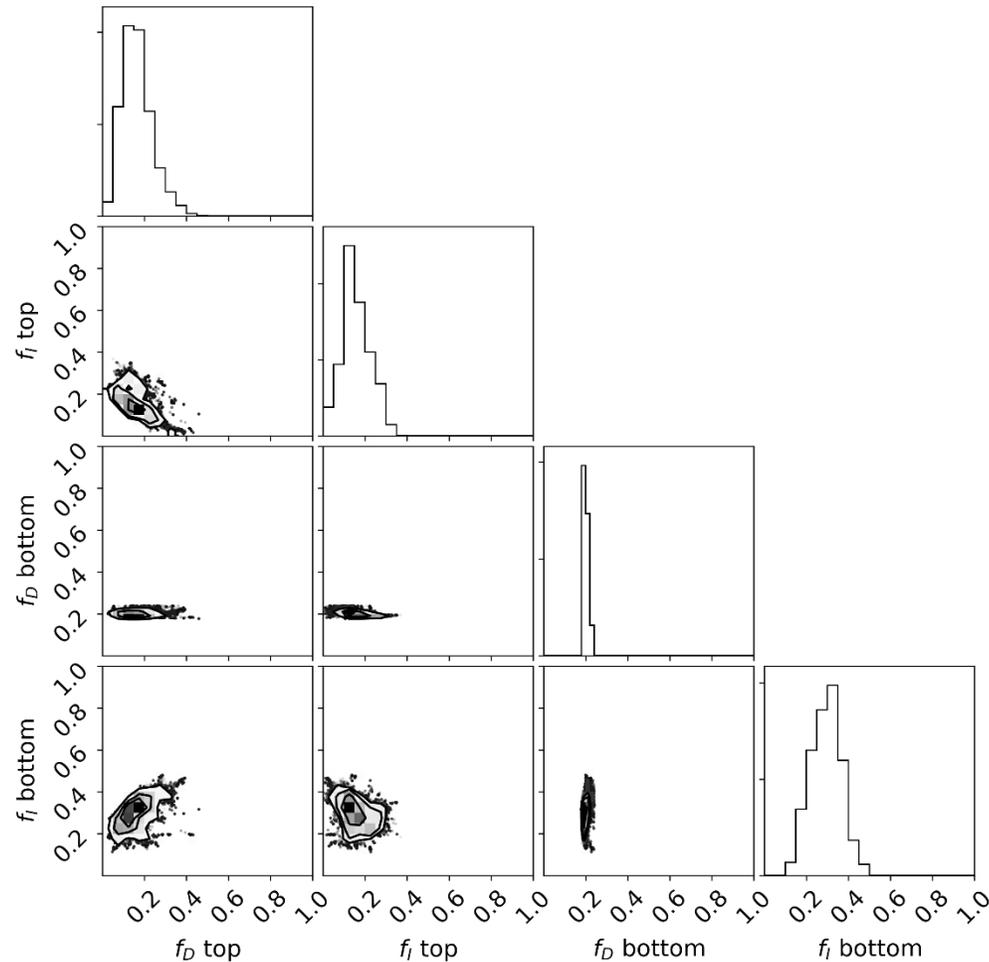

Explore parameter space until a global minimum for the root mean square is found.

- I. The Rosetta mission & comet 67P/C-G

IV. Thermal model & method

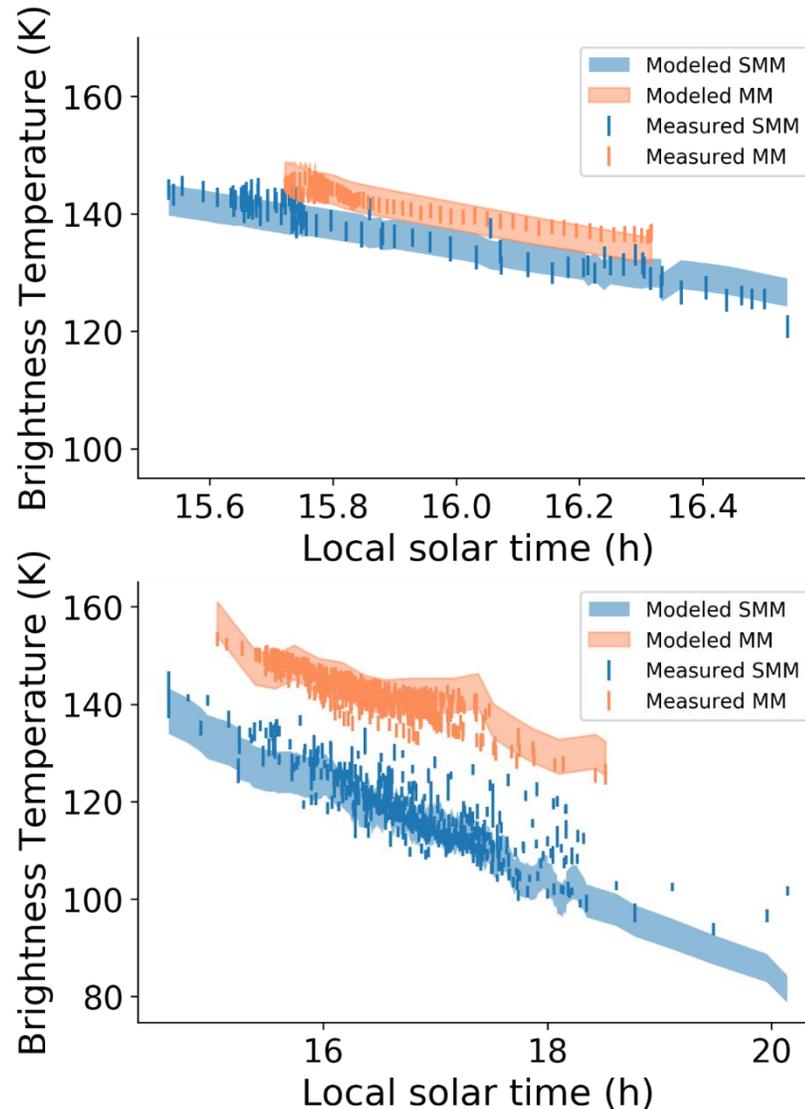

Using a Python ensemble sampling toolkit for affine-invariant MCMC (emcee: The MCMC Hammer. Foreman-Mackey et al. 2013):

- I. The Rosetta mission & comet 67P/C-G
- II. The internal structures of comets
- III. The Imhotep region
- IV. Thermal model & method
- V. Results and interpretation
- VI. Conclusion

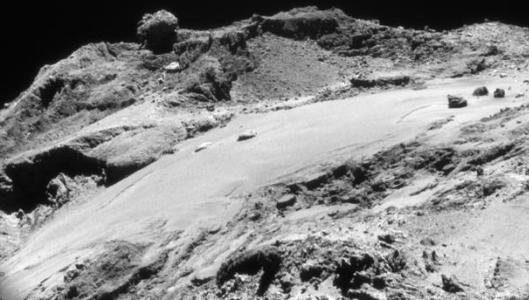

IV. Results and interpretation

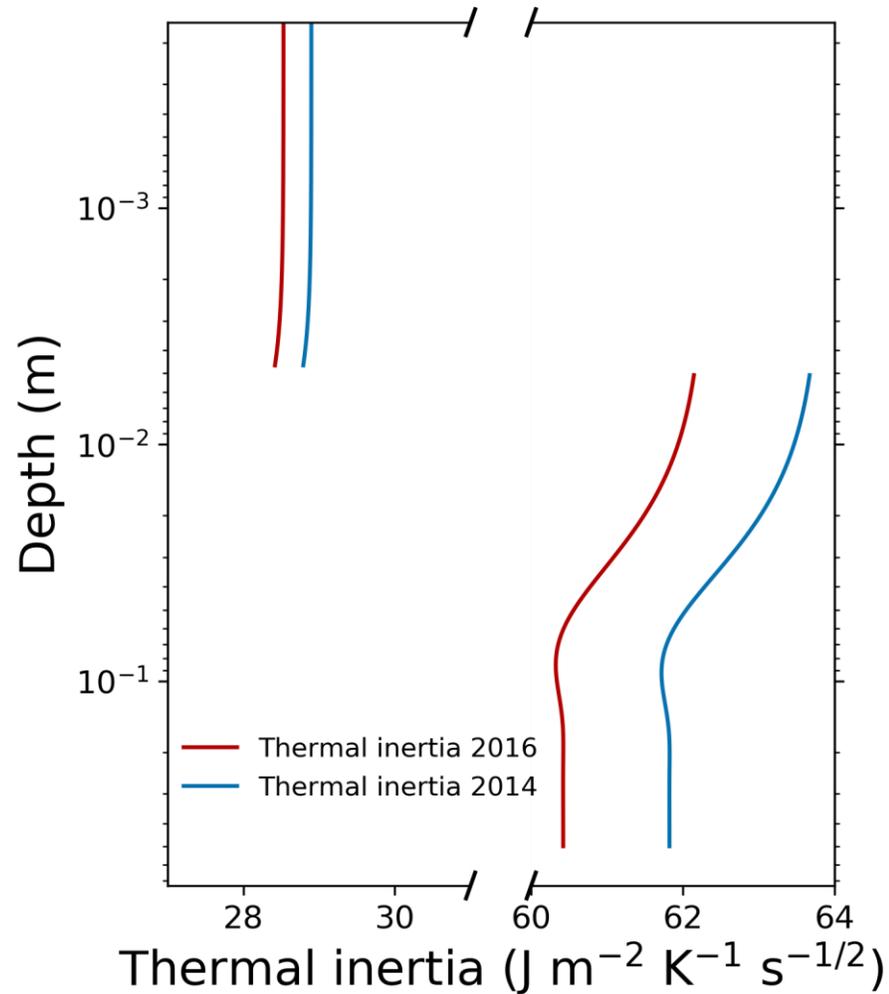

- For the first time we obtained a good fit in both the SMM/MM channels for both observations of the Imhotep region.
- Error bar in the model due to uncertainties in the electrical and thermal properties.
- The 2016 fit can be improved by being more selective with the observed areas.

- I. The Rosetta mission & comet 67P/C-G
- II. The internal structures of comets
- III. The Imhotep region
- IV. Thermal model & method
- V. Results and interpretation
- VI. Conclusion

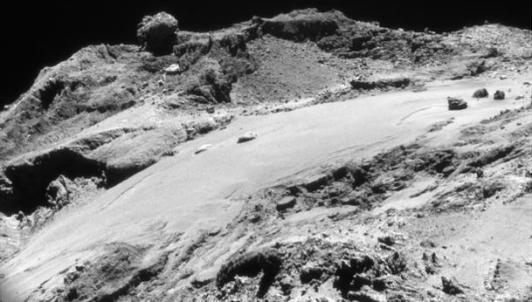

IV. Results and interpretation

- Big difference between both layers
- We have a thermally insulating layer on the top.
- The thermal inertia decreased between 2014 and 2016.

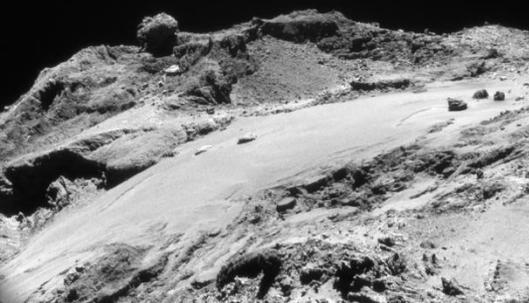

- I. The Rosetta mission & comet 67P/C-G
- II. The internal structures of comets
- III. The Imhotep region
- IV. Thermal model & method
- V. Results and interpretation
- VI. Conclusion

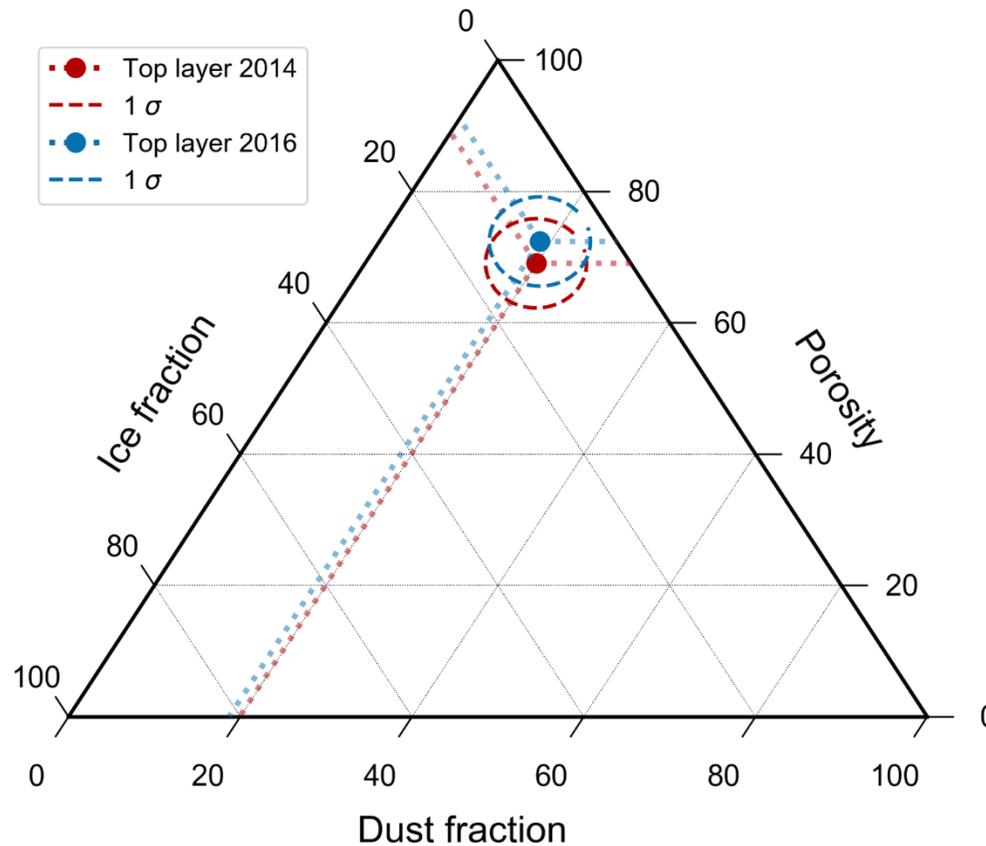

IV. Results and interpretation

Instrument	Region observed	Thermal inertia (J/m ² /K/S ^{1/2})
MIRO	All nucleus (2014)	10-50
MIRO	Imhotep and Ash (September 2014)	10-30
MUPUS	Abydos (November 2014)	50 – 120
MIRO	Seth, Ash and Aten (September 2014)	<80
VIRTIS	Seth, Ash and Aten (September 2014)	40-160
MIRO	Imhotep (October 2014 & July 2016)	60-64

- I. The Rosetta mission & comet 67P/C-G
- II. The internal structures of comets
- III. The Imhotep region
- IV. Thermal model & method
- V. Results and interpretation
- VI. Conclusion

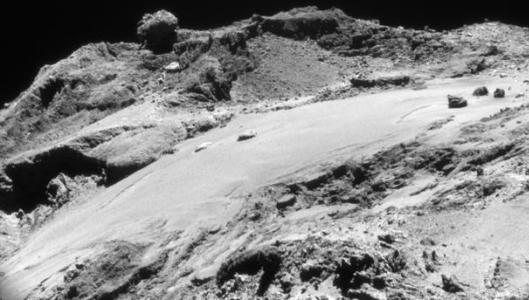

IV. Results and interpretation

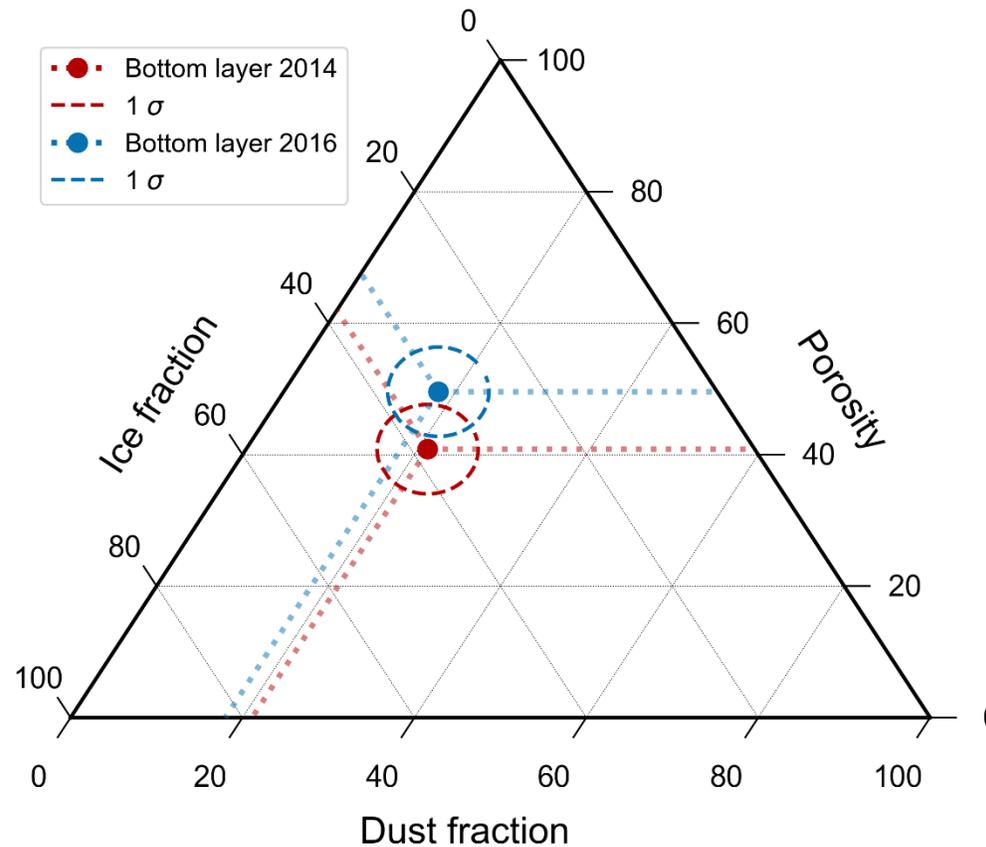

- At both dates we are in presence of top layer composed primarily of porous dust ($P > 70\%$).
- Between both observations there is small change in the properties.
- The change is not significant when compared to the error bar.

- I. The Rosetta mission & comet 67P/C-G
- II. The internal structures of comets
- III. The Imhotep region
- IV. Thermal model & method
- V. Results and interpretation
- VI. Conclusion

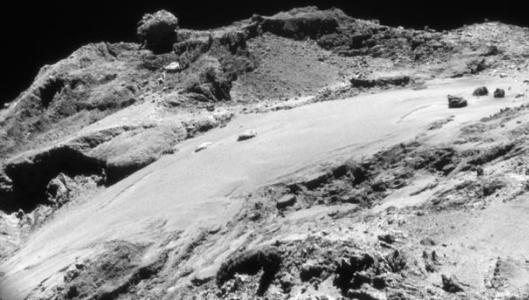

IV. Results and interpretation

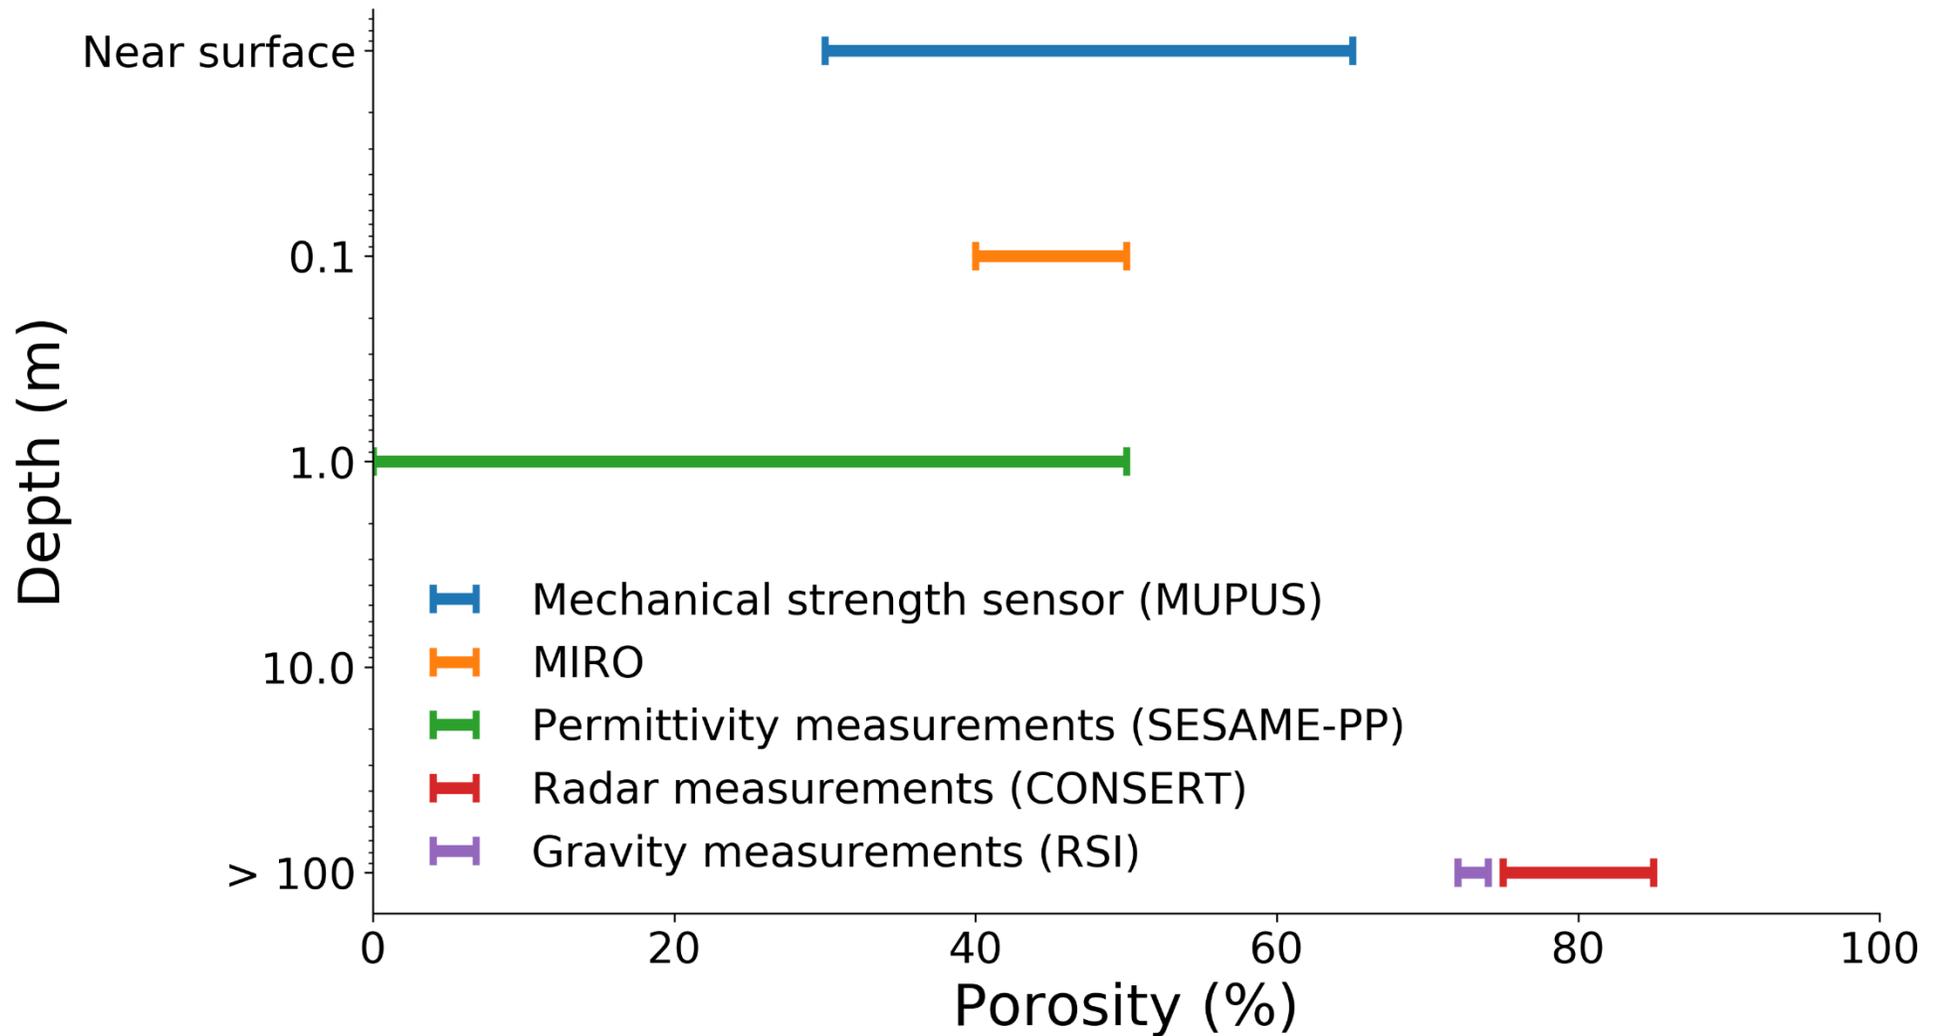

- At both dates we are in presence of more compact bottom layer ($P < 50\%$).
- The water ice volume in the bottom layer is higher than the dust volume (15-20% more).
- The models seem to imply that there is less water ice and more porosity in 2016 than in 2014.

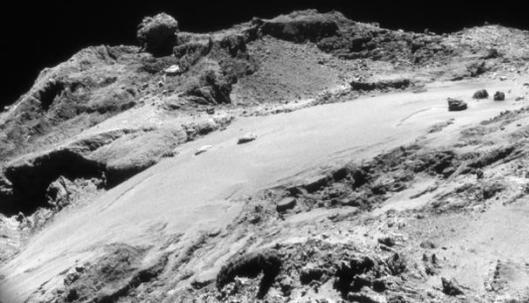

- I. The Rosetta mission & comet 67P/C-G
- II. The internal structures of comets
- III. The Imhotep region
- IV. Thermal model & method
- V. Results and interpretation
- VI. Conclusion

IV. Results and interpretation

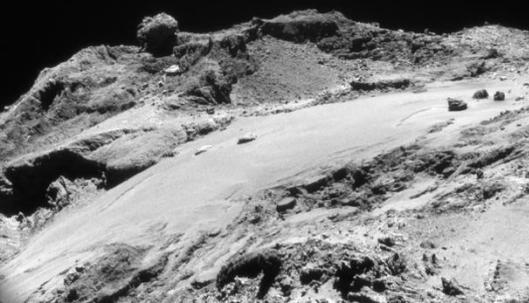

- I. The Rosetta mission & comet 67P/C-G
- II. The internal structures of comets
- III. The Imhotep region
- IV. Thermal model & method
- V. Results and interpretation
- VI. Conclusion

Conclusion

- We obtained for the first time a good fitting model to the high resolution measurements made by MIRO of the Imhotep region.
- We observe a decrease in water ice content and an increase in porosity consistent with a sublimation of water ice in the subsurface as the comet went by perihelion.
- To obtain a good fit, conservative assumptions were made, resulting in error bars on the composition that are as big as the changes observed.
- Explore additional assumptions on the subsurface.
- Explore different geomorphological regions
