

Mars Small Spacecraft Concept Studies

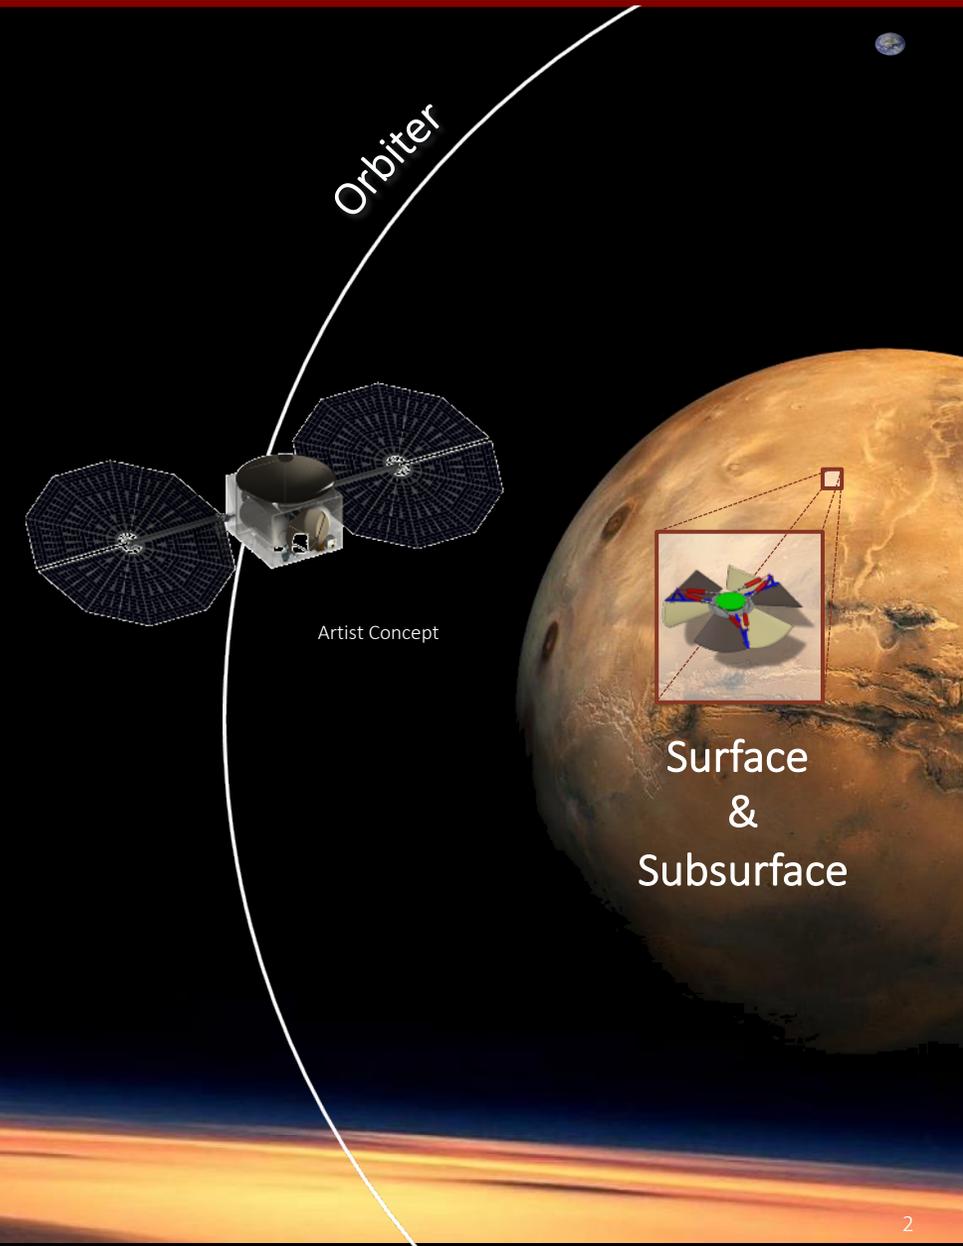

Nathan Barba, Tom Komarek, Ryan Woolley, Lou Giersch,
Vlada Stamenković, Mike Gallagher, and Charles D. Edwards

2019 IEEE Aerospace Conference

March 7, 2019

- Potential Mars Sample Return campaign focused on returning samples collected by M2020.
- Desire for parallel science investigations during MSR.
- Need for smaller, affordable missions to perform important science investigations.
- Possibility of missions with constellations and networks to conduct multi-point science observation and ground-truthing.

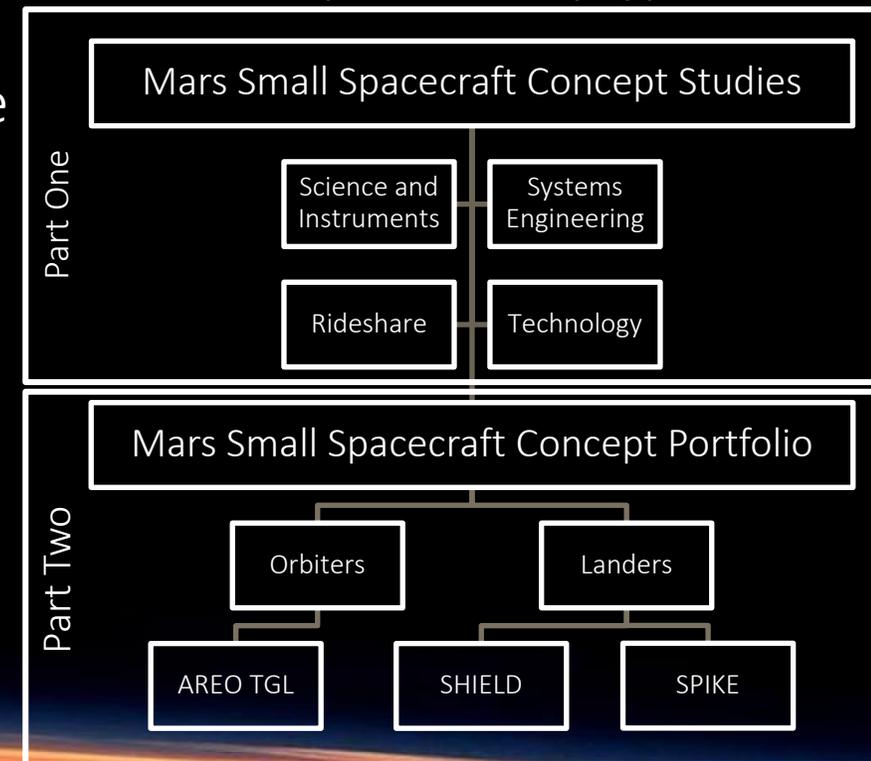

Key Questions

- Can small spacecraft missions deliver **compelling science**?
- Are the small spacecraft mission concepts **technically feasible**?
- Can these small spacecraft missions studied fit into an **affordable cost** envelope?

Goals for all mission concepts studied:

- The mission should be **science driven**, with goals traceable to the Decadal Survey, MEPAG goals, HEO SKGs, etc.
- S/C mass target: **250 kg +/- 100 kg (ESPA Class)**
- Transport to Mars
- Mission cost target: **< \$200M**, includes cost for launch, rideshare, or piggyback config.
- Provide concept examples for both Orbiters and Landers

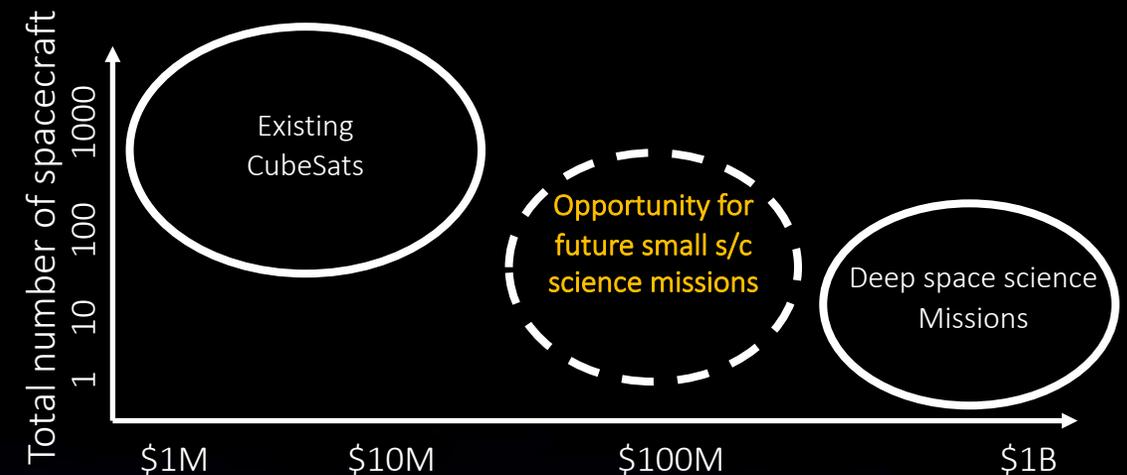

Mars Small Spacecraft Study Approach

Small Spacecraft Mass and Volume Target

S/C Mass and Volume Target Motivation (250 kg +/- 100 kg, ESPA Class)

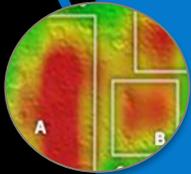

- Spacecraft should have the capability to transit on its own propulsion from Earth orbit to Mars.
- Possible order of magnitude cost savings for launch services.
- Spacecraft science payload capacity target is < 10 kg of science payload for orbiters and < 5kg of landed science payload.
- Strong development in commercial small spacecraft sector.
- JPL currently developing enhancing technology for small spacecraft telecommunications and propulsion.

- Timely & recent decadal class science questions well suited for Mars small spacecraft in Mars orbit.

Trace Gas Localization

- Questions: where is methane coming from, where is it destroyed? Is the source abiotic or biotic (extinct vs extant).
- Areostationary configuration can answer this question.

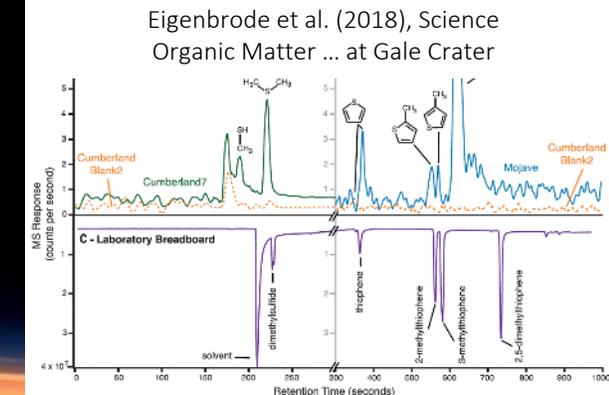

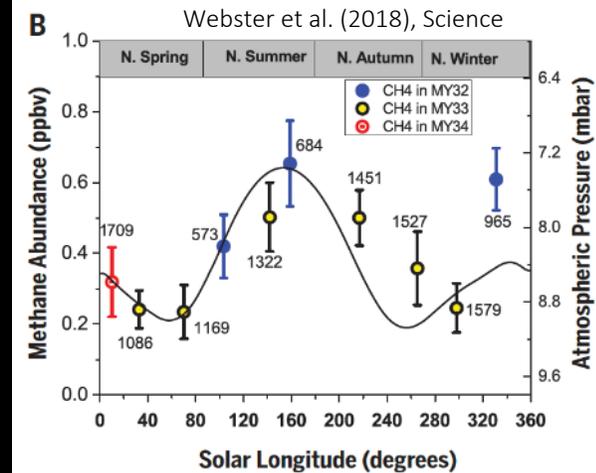

Delivery of Organics by Meteoroids

- Questions: How much material, especially organics, is delivered to the surface (Exogenic Influx)
- CCD whole-disk monitoring device with selected filters staring from areostationary orbit can address this question.

Evidence of seasonally variable CH₄ and carbonates

- Timely & recent decadal class science questions well suited for Mars small spacecraft for Mars surface/subsurface.

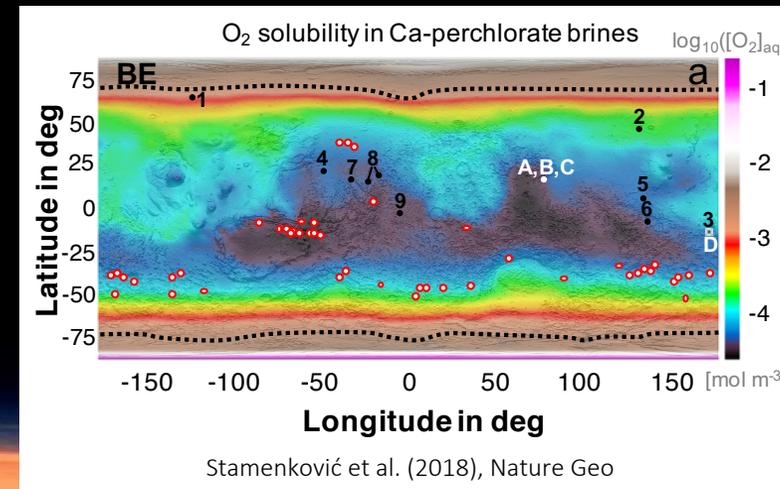

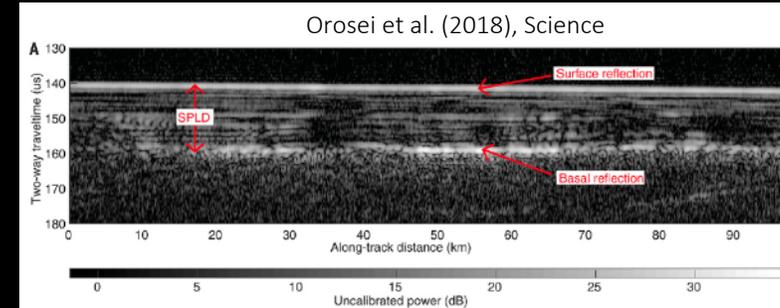

Groundwater

- Questions: Is there liquid water in the subsurface, what is its chemistry?
- Mini EM sounders (using induction) and B-field sensors can address this question.

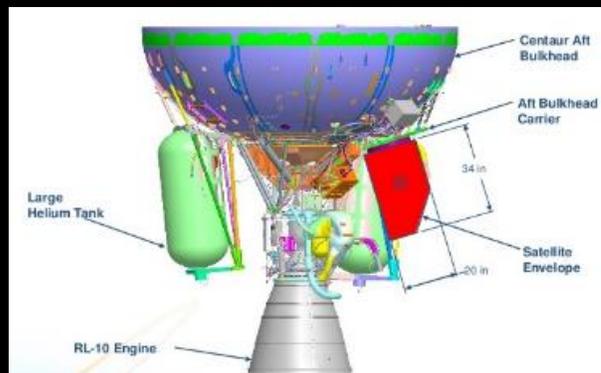

4-D Networks & Scouts

- Questions: What is the spatial and temporal variability in key properties across the surface and subsurface (with surface assets or penetrators)?
- Sniffers, EM field, weather, subsurface-atmosphere exchange (global coverage of fundamental fast-changing processes)

Evidence of groundwater, near-surface brines and aerobic environments

Three Key Methods to Get Small Spacecraft to Mars

Source: ULA, Aft Bulkhead Carrier Auxiliary Payload User's Guide

Small spacecraft mounded on Aft Bulkhead Carrier (ABC)

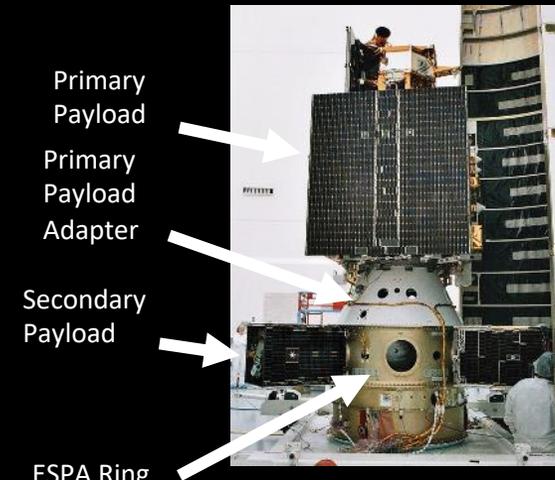

Source: NASA/JPL/Caltech

Deep Space 2 piggyback released prior to arrival on Mars Polar Lander Mission in 1999.

Many small LVs are in development for Earth/Moon use. Firefly + solid motor would be capable to reach Mars. Others may follow.

Path to Mars Orbit Via Rideshare

AREO TGL: Areostationary Concept Case Study

Features

Mass: 220kg to 350kg per spacecraft

Target: Mars – Areostationary Orbit (17,000 km)

Configuration: Single spacecraft, future constellation.

Launch: Secondary Payload on ESPA Grande

Cruise: Solar electric propulsion

Enabling Technology: None required

Risk Class: D

Cost : \$100 M to \$200 M per spacecraft

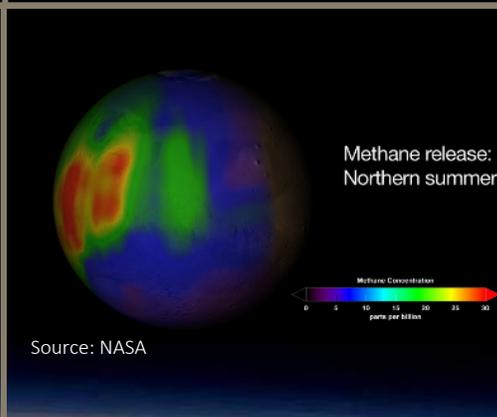

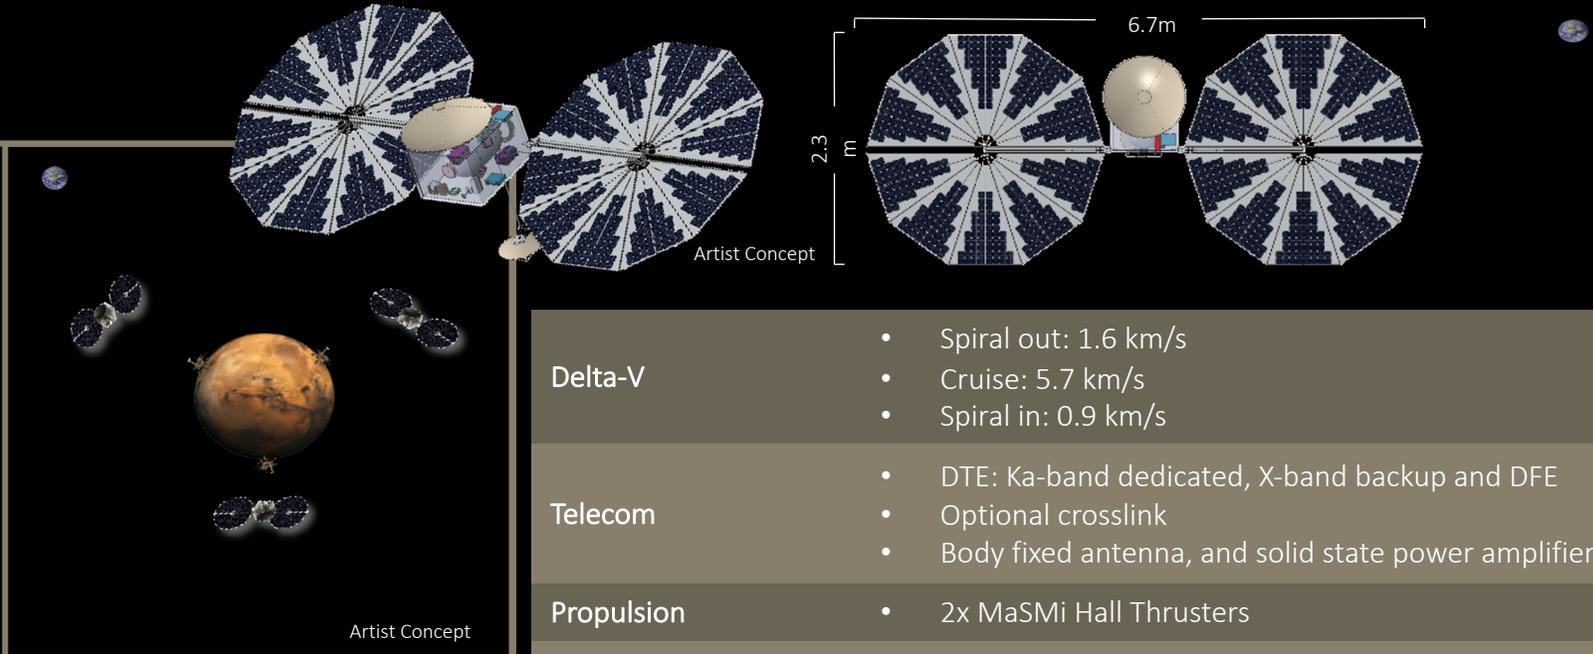

Lifetime: ~3 Earth years on orbit then replenished.

Science and Instruments

- Localization and diurnal concentrations of methane, other trace gases, and water.
- Spatial Heterodyne Spectrometer (JPL)
- TBD - Camera

Telecom

- X-Band proximity link to surface, MSL-like rates.
- Ka-Band, Direct to Earth, MAVEN-class data rates.

Delta-V

- Spiral out: 1.6 km/s
- Cruise: 5.7 km/s
- Spiral in: 0.9 km/s

Telecom

- DTE: Ka-band dedicated, X-band backup and DFE
- Optional crosslink
- Body fixed antenna, and solid state power amplifier.

Propulsion

- 2x MaSMi Hall Thrusters

ACS

- 0.2 degree pointing capability

Power

- 2.1kW(BOL) lightweight SA
- Secondary batteries – 250Wh capacity

C&DH

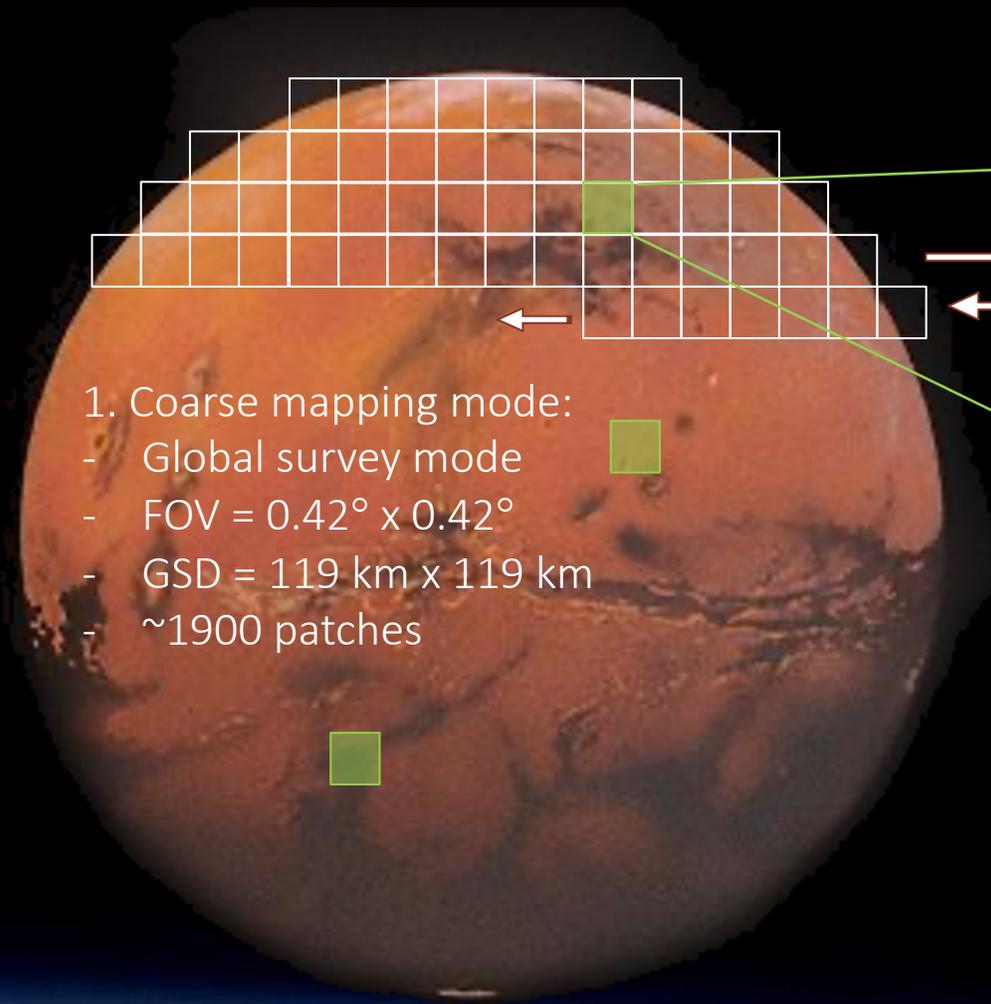

- Dual-Core LEON3FT (SPHINX), 100MHz, 8GB NAND
- Interfaces: RS422, SPI, I2C, Spacewire, GPIO, UART

Mechanical

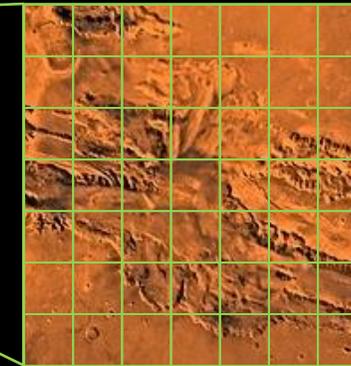

- ~1m x ~1m x ~1m
- Compatible with ESPA/ESPA Grande

Payload

- Spatial Heterodyne Spectrometer
- Multispectral Wide Field

1. Coarse mapping mode:
- Global survey mode
 - FOV = $0.42^\circ \times 0.42^\circ$
 - GSD = 119 km x 119 km
 - ~1900 patches

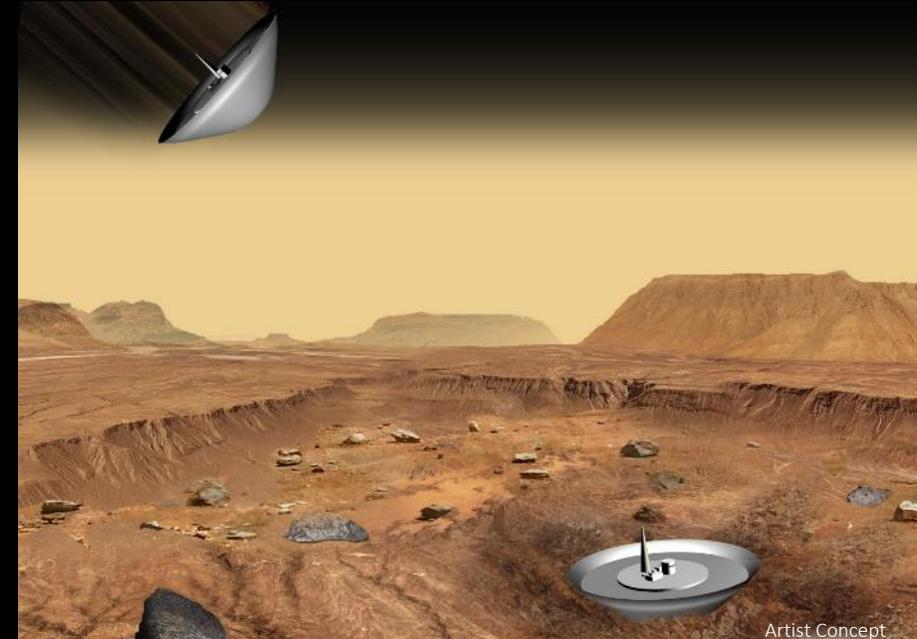

2. Detail mapping mode:
- Region of interest (ROI) identified
 - FOV = $0.06^\circ \times 0.06^\circ$
 - GSD = 17 km x 17 km
 - 49 points

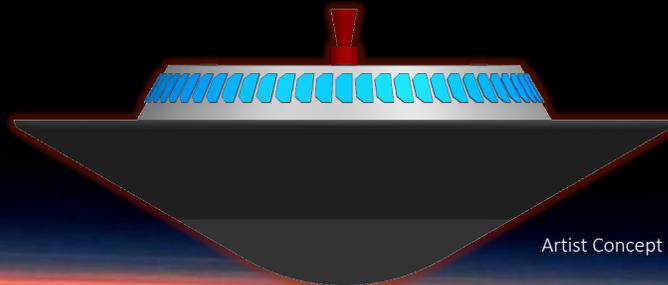

SHIELD: Surface/Subsurface Concept Case Study

SHIELD – Small High Impact Energy Landing Device

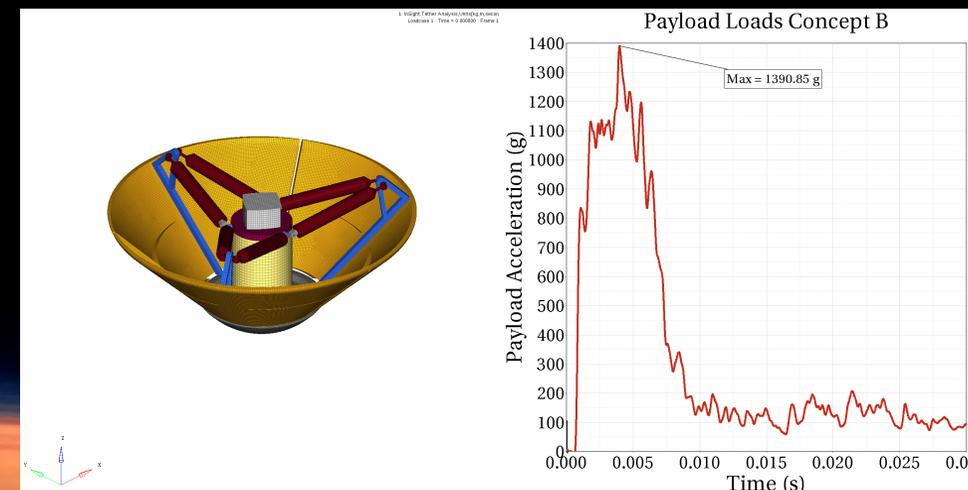

- SHIELD enables the transportation of small scientific payload(s) affordably to the surface
- Mass target of <50kg
- Entry Velocity target: 60 m/s,
- Expected impact on payload < 1000g.
- Total science payload up to 5 kg.
- Science payload can vary, investigating options for mobility.
- Science goals of high priority for Decadal science, MEPAG, and HEO SKG's.

Artist Concept

Artist Concept

Identified Enhancing Technologies for Interplanetary Small Spacecraft

- Deep Space Telecommunications
 - Deep space low-power low mass transponder (JPL)
 - Low mass, low power Ka-Band Klystron amplifier (SBIR)
 - Deployable antennas (JPL)
- Solar Electric Propulsion Thrusters
 - High through-put low-mass hall thrusters (JPL)
- Incubator for future Mars small spacecraft technology
 - TH₂OR Water Sounding Instrument
 - SHIELD Surface Lander

Transmission H₂O Reconnaissance Instrument

Scientifically Compelling

Mars small spacecraft can accomplish decadal class science whilst being complementary to Flagship missions.

Low Cost

Mars small spacecraft can get to Mars for the cost of < \$250 M which includes phases A to D and the launch vehicle.

Technically Feasible

Mars small spacecraft can transit to Mars from Earth GTO and fit within the EELV Secondary Payload Adapter (ESPA) mass and volume constraints.

Small affordable spacecraft missions from Earth GTO to Mars are possible and deliver Decadal-class science complementary to Flagship missions.
